

Figure S1. Rarefaction curve and Spearman correlation between diversity and richness of rarefied and non-rarefied samples. (a) Rarefaction curve displaying the number of ASVs against the number of sequences for each sample. The vertical red dashed line indicates the rarefaction depth used for all samples (i.e., 2,530 reads per sample). (b) Correlation between calculated Shannon diversity of rarefied and non-rarefied samples. (c) Correlation between ASV richness of rarefied and non-rarefied samples. Linear regression is showed in red, and the dotted line represents a one-to-one theoretical relationship where rarefaction has no impact on diversity and richness. The R^2 denotes the Spearman correlation coefficient ($n=71$).

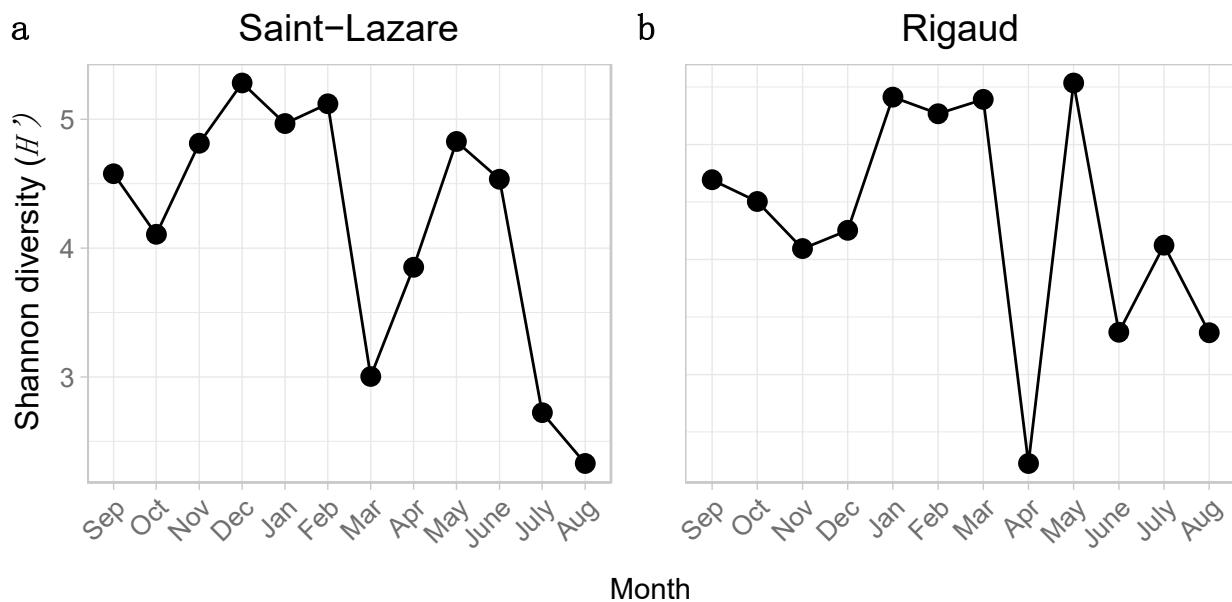

Figure S2. Shannon diversity of groundwater bacterial communities of both aquifer across the sampling period. (a) The Saint-Lazare aquifer. (b) The Rigaud aquifer. Only one sample was collected for each month.

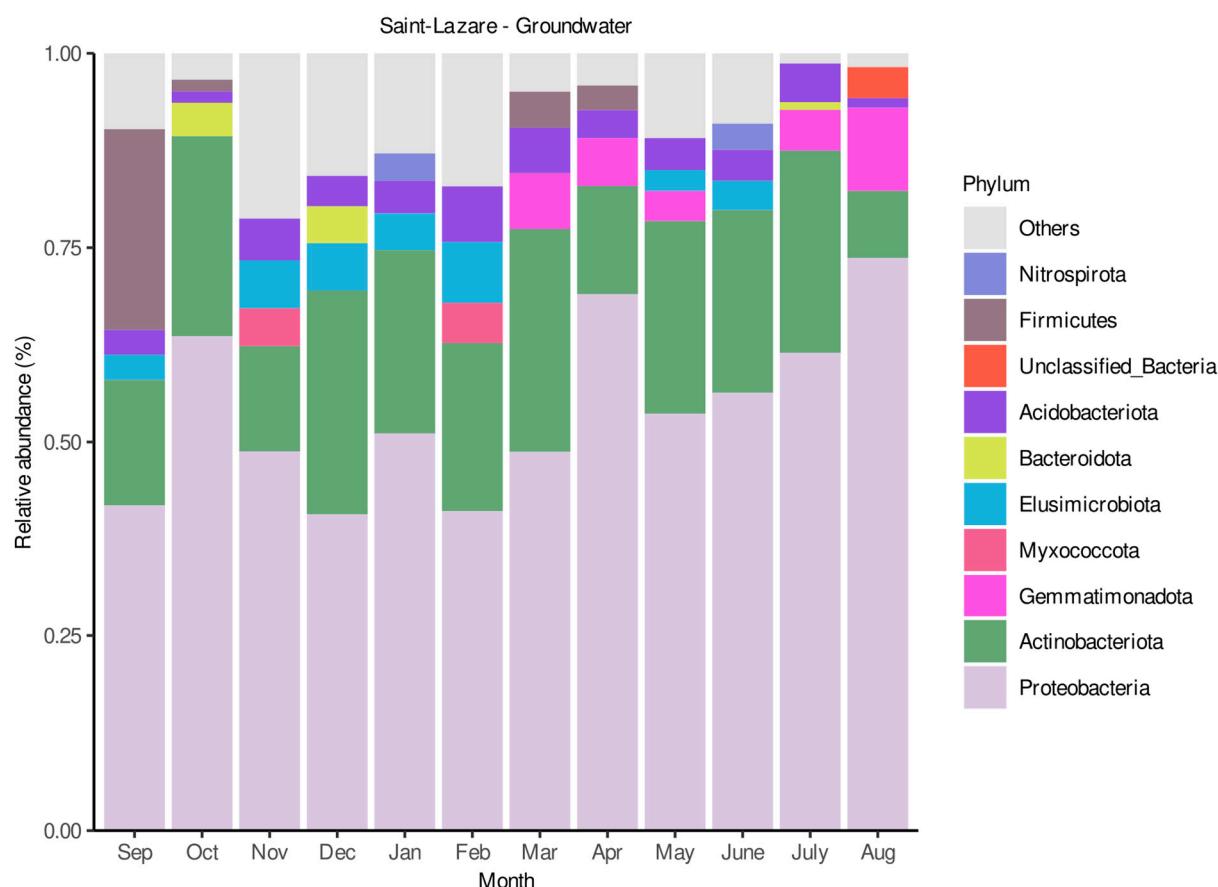

Figure S3. Relative abundance (%) of amplicon sequence variant (ASV) at the phylum level in groundwater samples collected monthly at the Saint-Lazare site. For each month, only the five most abundant families are colored.

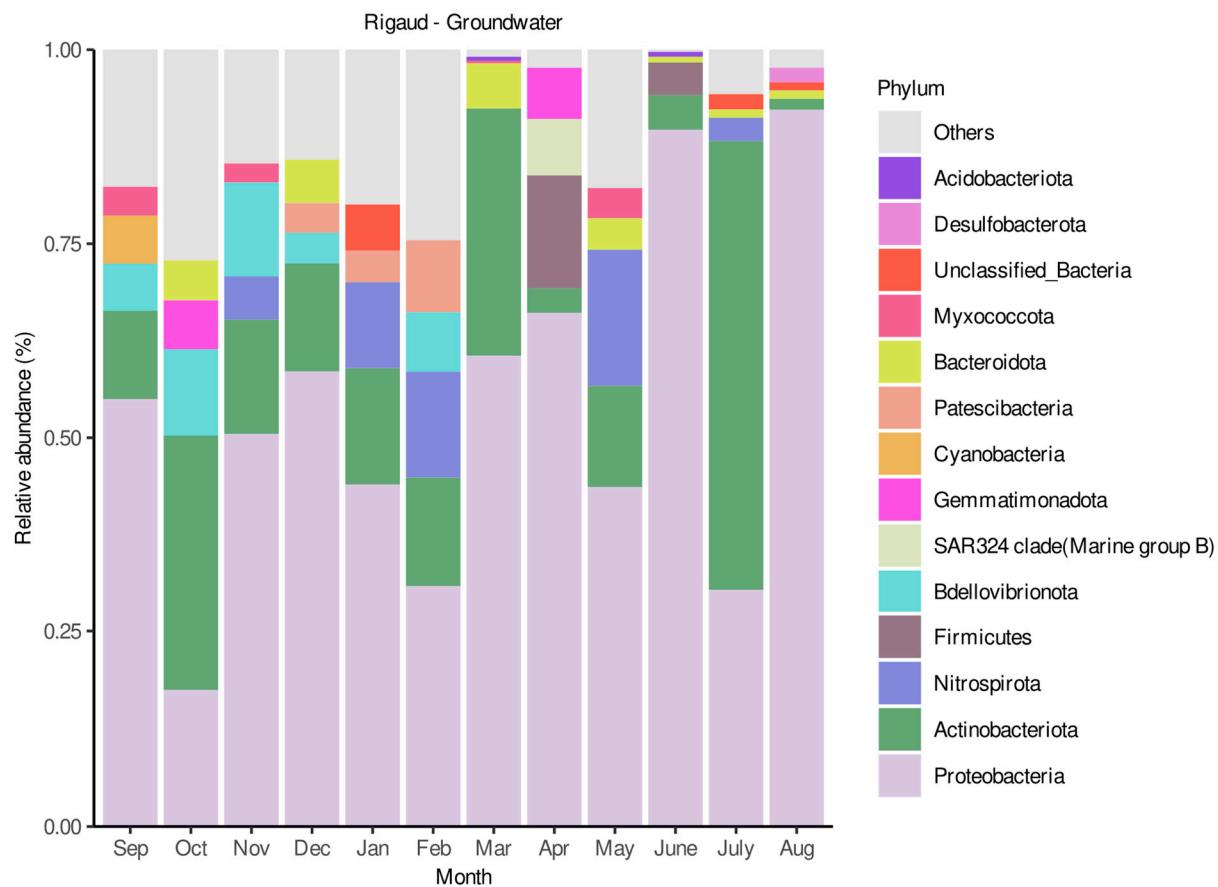

Figure S4. Relative abundance (%) of amplicon sequence variant (ASV) at the phylum level in groundwater samples collected monthly at the Rigaud site. For each month, only the five most abundant families are colored.

Table S1. Maximum and minimum daily average of each month for groundwater level and temperature from both aquifers. Data was collected by a probe installer semi-permanently in each well. Hourly measures were averaged for each date. Level indicates the height in meter (m) of the water above the probe.

Month	Saint-Lazare				Rigaud			
	Groundwater temperature (°C)		Groundwater level (m)		Groundwater temperature (°C)		Groundwater level (m)

July	2.72338	4.12376
August	2.32898	3.36365

Table S6. Average contribution (%) of each source to groundwater bacterial diversity of both aquifers. Potential sources for both aquifers include groundwater, snow, and soil. For the Rigaud aquifer river were also considered given the groundwater-river connections. For each source, only samples collected up to three months prior to groundwater sample assigned as sink were included.

Aquifer	Sink	Groundwater	River	Snow	Soil	Unknown
