**Figure S1:** Bacteria growth before (0H) and after incubation (24H/48H or 96H) of MIC assays for each bacteria strain using the isobutyl-cyanoacrylate nanoparticles (D60 & NP30) and their respective dispersants.

Figure S2: Monthly feed conversion ratio per treatment where different letter superscripts, *a*, and *b*, indicate significant differences between treatments and or sampling time ( $P < 0.05$ ). CT = Control group; M1, M2 & M3 = Months 1,2 & 3. All data were expressed as means  $\pm$  SEM,  $n = 2$ .
