

Figure S1: Exposure of non-infected *M. polaris* to UV-A radiation. (a) Phytoplankton abundance dynamics, (b) Photosynthetic efficiency (F_v/F_m , relative units r.u., normalized to starting value). Average values with standard deviation ($n = 2$ except for PAR-only control and 28 h UV-AB where $n = 1$). The horizontal black bars indicate the dark period.

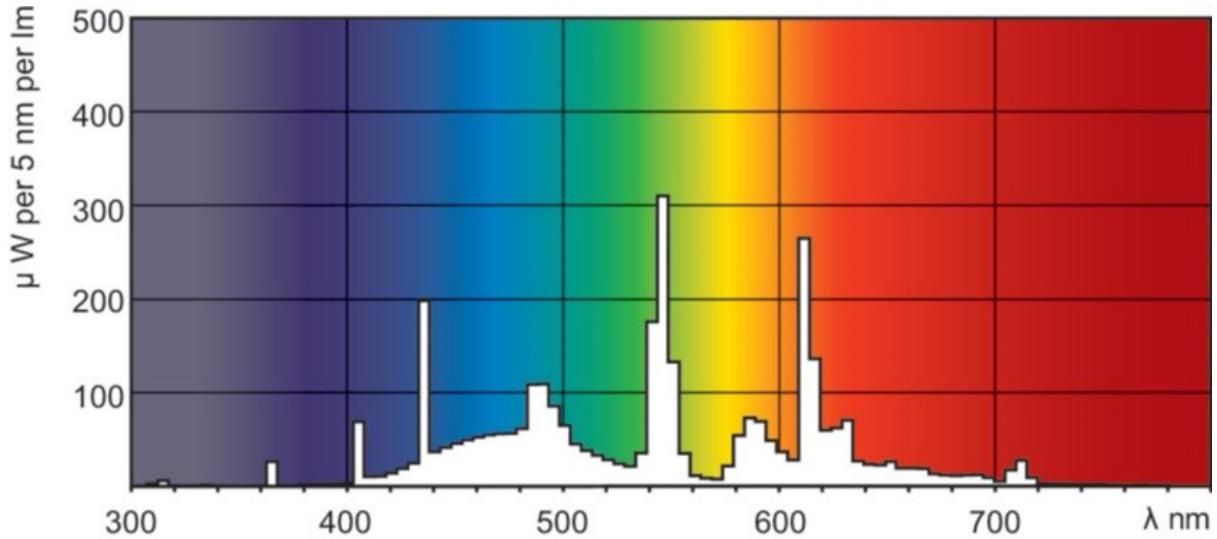

Figure S2: Light spectrum of lamps used to provide PAR.

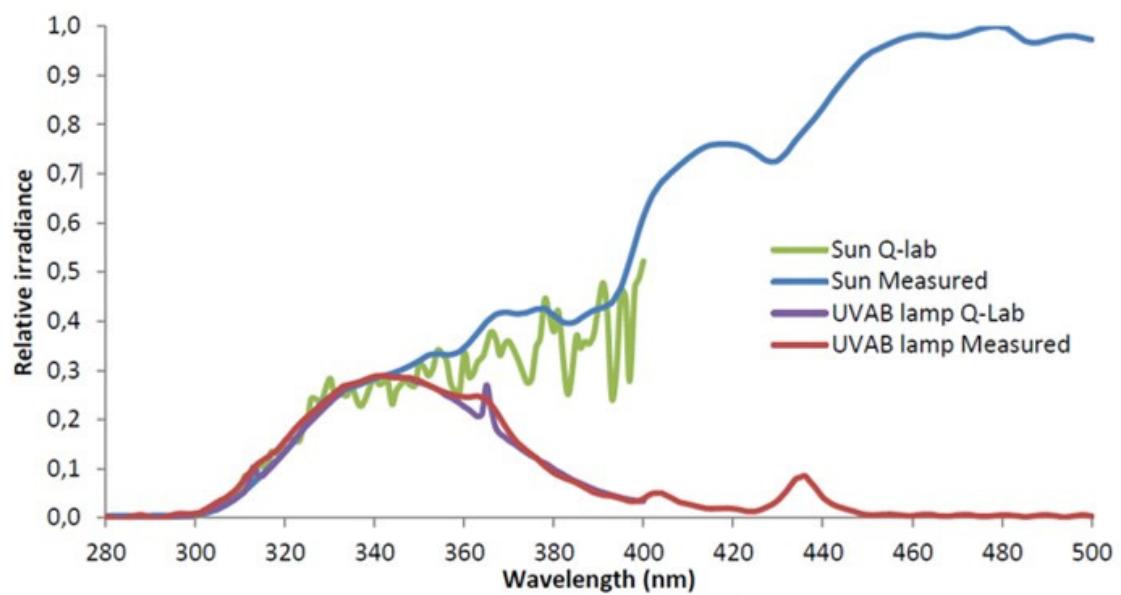

Figure S3: Light spectrum of UV-AB lamps.

Table S1: UV-AB intensities and attenuation coefficients (μac). The averages of these values were used to calculate the average UV-dose received in the Mixed Layer Depth (MLD) of polar regions. Average μac for the Arctic were 0.665 and 0.28 for UV-A and UV-B, respectively, with average UV-intensities (UV-I) of 6.6 and 0.4 each and MLD was up to 30 m. For the Southern Ocean, average μac were 0.38 and 0.28 for UV-A and UV-B, with average intensities of 27.9 and 1.1 for UV-A and UV-B, respectively, with a maximum MLD of 50 m. The UV-intensity at a given depth ($UV - I_D$) was calculated using the following formula following formula: $UV - I_D = UV - I * e^{n*(-\mu\text{ac})}$, with n being the depth in meter in steps of 1. The resulting values were averaged over the MLD for each region to get to the average UV-Intensity within the mixed layer.

	UV-Intensities			Attenuation Coefficients		
	UV-A (W m ⁻²)	UV-B (W m ⁻²)	reference	UV-A (m ⁻¹)	UV-B (m ⁻¹)	reference
Arctic	0.38 - 0.47	0.015 - 0.0189	[1]	0.39 - 0.94	0.225	[2]
	19	1.09	[3]		0.34	[4]
Southern Ocean		1.8	[2]			
	35	0.9	[5]	0.19 - 1.1		[2]
	20.8	0.5	[6]	0.157 - 0.262	0.284	[7]

Table S2: Values needed to calculate UV-C exposure times: Three phytoplankton viruses were exposed to UV-C doses between 0 – 800 mJ cm⁻². UV-C doses were controlled by exposure time. Needed exposure time was calculated following [8] using the following values:

Solution volume	15 mL
Water path length	0.63 cm
Distance UV-lamp to water surface	48.6 cm
Divergence Factor	0.9872
Absorption Coefficient	0.008 cm ⁻¹
Total Absorbance	0.001
Water Factor	0.9988
Petri Factor	0.818 – 0.832 mW cm ⁻²
Reflection Factor	0.975
Divergence Factor	0.986
Resulting average germicidal irradiance throughout the water column	0.644 – 0.666 mW cm ⁻²

Table S3: Abundances of *Micromonas polaris* ($\times 10^5$ mL $^{-1}$) for cultures without viruses added (C) and with MpoV-45T added (V), exposed to PAR-only (controls) or UV-AB for total duration of 6, 12, 28 and 48 h for experiment 1 and experiment 2 ($n = 2$, except for Exp. 1 PAR-only controls where $n = 1$).
