Experimental

Biological activity

Cytotoxicity

Roswell Park Memorial Institute Medium (RPMI 1640), Gibco, USA, was used to culture A549 (human lung adenocarcinoma), MDA MB 231 (breast adenocarcinoma) and SKOV3 (ovary adenocarcinoma) cell lines. FBS (10%) and 100 units/mL PS (penicillin/streptomycin) were supplied to that same media. The cells incubated at 37°C in a humidified environment with 5% carbon dioxide. The activity was performed according to our reported work [32]. The positive control used was Tamoxifen and the O.D. was calculated at 540 nm using a microplate reader (FluoStar Omega (BMG Labtec, Ortenberg, Germany)).

Cell cycle analysis

The most promising compounds (8, 9, 10, 13) with IC₅₀s values were pre-calculated and delivered to cancer cells for 48 hours. A549, MDA,MB 231 and SKOV3 cells were then trypsinized, washed twice in PBS (phosphate buffered saline), and then resuspended in propidium iodide (PI) (500 µL) with RNase staining buffer from Cell Signaling Technology (CST) and incubated for 15 minutes. Fluorescence activated cell sorting analysis were carried out using a Cytex[®] Northern Lights 2000 spectral flow cytometer using SpectroFlo™ Software version 2.2.0.3, to evaluate the data from 10,000 cells and the distribution of cell cycle phases for each sample [37].

Apoptosis analysis

LS174T cells treated with compounds (8, 9, 10, 13) for 48 hr. and then trypsinized and washed twice with PBS. The assessment of apoptosis was performed using Annexin V-FITC/PI analysis Kit, Cell Signaling Technology (CST), as instructed by the manufacturer [38].

Table S1: *In silico* toxicity study of compounds **10** and **13**

Compounds	Max. Tolerated dose (Human) mg/kg/day	Oral rat acute toxicity (LD50) mol/kg	Oral rat chronic toxicity (LOAEL) mg/kg bw/day	Hepatotoxicity	Skin Sensitization
10	0.3	2.438	-0.145	No	No
13	0.125	2.472	-0.344	No	No
Erlotinib	0.002	2.368	0.88	Yes	No
