Figure S1: Cyclic voltammetries of ZING carried out in different conditions: in N₂- (Panel A), air- (Panel B) and O₂- saturated (Panel C) monomer solution. $\Delta E = 0 \div 2.0$ V, scan rate: 100 mVs⁻¹. 1 to 5 cycles are reported.

ZINGERONE DIMER

Figure S2: Cyclic voltammetries of ZING DIM carried out in different conditions: in N_2 - (Panel A), air- (Panel B) and O_2 - saturated (Panel C) monomer solution. $\Delta E = 0 \div 2.0$ V, scan rate: 100 mVs^{-1} . 1 to 5 cycles are reported.

Figure S3: Michaelis-Menten kinetics plot (Panel A) ranging from 0 to 50 mM and linear regression curve (Panel B) ranging between 0-400 μ M of PPD-based glutamate biosensor design at Day 1. Pt_c: Pt cylinder 1 mm long, 125 μ m diameter; PPD: polyortho-phenylenediamine; PEI: polyethyleneimine; GlutOx: Glutamate Oxidase; TEG: triethyleneglycol. The subscript number indicates the number of dipping steps and in brackets, the concentration of the component.

Pt_c/polyZING/[PEI(1%)-GlutOx]₅/TEG(0.1%)

Figure S4: Michaelis-Menten kinetics plot (Panel A) ranging from 0 to 50 mM and linear regression curve (Panel B) ranging between 0-400 μM of polyZING-based glutamate biosensor design at Day 1. Pt_c: Pt cylinder 1 mm long, 125 μm diameter; polyZING: polymer from ZING; PEI: polyethyleneimine; GlutOx: Glutamate Oxidase; TEG: triethyleneglycol. The subscript number indicates the number of dipping steps and in brackets, the concentration of the component.

Figure S5: Michaelis-Menten kinetics plot (Panel A) ranging from 0 to 50 mM and linear regression curve (Panel B) ranging between 0-600 μM of PPD-based glutamate biosensor design at Day 1. Pt_c: Pt cylinder 1 mm long, 125 μm diameter; polyZINGDIM: polymer from ZING DIM; PEI: polyethyleneimine; GlutOx: Glutamate Oxidase; TEG: triethyleneglycol. The subscript number indicates the number of dipping steps and, in brackets, the concentration of the component.

Table S1: In vitro parameters of three different glutamate biosensor designs (n=4) at Day 1 in terms of Michaelis–Menten kinetic parameters (V_{MAX} and K_M) and analytical parameters (Linear Region Slope –LRS, LOD and LOQ) for each design. PPD-based: Pt_c/PPD/PEI(1%)₂/GluOx₅/TEG(0.1%); polyZING-based: Pt_c/polyZING/PEI(1%)₂/GluOx₅/TEG(0.1%); polyZINGDIM-based: Pt_c/polyZINGDIM/PEI(1%)₂/GluOx₅/TEG(0.1%). Pt_c: Pt cylinder 1 mm long, 125 μ m diameter; GluOx: L-glutamate oxidase; PPD:poly-ortho-phenylenediamine; polyZING: polymer from ZING; polyZINGDIM: polymer from ZING DIM; PEI: polyethyleneimine; TEG: triethyleneglycol. The subscript number indicates the number of dipping steps and in brackets, the concentration of the component. * $p < 0.05$ vs PPD; *** $p < 0.01$ vs PPD; **** $p < 0.001$ vs PPD.

Biosensor Design	V_{MAX} (nA)	K_M (μ M)	LRS (nA/ μ M)	LOD (μ M)	LOQ (μ M)	1 mM AA (nA)
PPD-based	192.6 \pm 9.4	636.0 \pm 81.3	0.164 \pm 0.002	0.237 \pm 0.001	0.791 \pm 0.002	0.398 \pm 0.163
polyZING-based	111.4 \pm 5.1***	451.5 \pm 41.2*	0.125 \pm 0.003****	0.686 \pm 0.004	2.285 \pm 0.012****	5.307 \pm 0.054****
