1. Molecular Modeling

The Schrödinger Maestro(version 13.7) was used to perform the ensemble docking calculations. The HIV-1 reverse transcriptase X-ray structure used for the experiment had the PDB code: 3QIP. The protein's 3D structure was prepared using the Protein Preparation Workflow. The protein preparation followed a standard protocol: (1) addition of missing hydrogen atoms to the X-ray structure, (2) removal of all crystallographic water, (3) assignment of ionizable state to each titrable groups by PropKa, and (4) energy minimization using OPLS4 force field to optimize all hydrogen-bonding networks. The docking study was performed using Glide-docking module. The small molecule, taken from the PDB structures, was rocked into its corresponding protein structure at the Standard Precision (SP) without the need for any constraints. The stability of the simulation was assessed by monitoring the RMSD with respect to the minimized starting structure. The molecular docking result was generated using PyMol (<http://pymol.sourceforge.net/>).

2. Molecular Dynamic Simulations

We obtained the RMSF (Root Mean Square Fluctuation) (Figure 5A, Figure 5B), RMSD (Root Mean Square Deviation) (Figure 5C), dynamic hydrogen bond count (Figure 5D) using the GROMACS software. The RMSF plots (Figure 5A-5B) for p66 and p51 further illustrated the structural fluctuation range of amino acid residues in both peptide chains upon the binding of compound **12b** to the RT enzyme. The dynamics simulation software GROMACS (version 2023.3) was used to investigating the dynamic equilibrium stability of protein-ligand docking. We generated PDB files for the protein, ligand and magnesium ion using the molecular docking structure information obtained from Maestro. In the system environment of Ubuntu 22.04, we selected AMBER14 as the molecular force field. We selected a 0.15M sodium chloride (NaCl) aqueous solution as the environmental system and balanced the charges. We equilibrated the system at a temperature of 310 K and maintained standard atmospheric pressure as the equilibrium pressure. Then we ran the dynamics simulation. After that, we analyzed the simulation trajectory and obtained the results of RMSD, RMSF and numbers of H-bond. The gmx_MMPBSA(version 1.5.0.3) was used to calculate the binding free energy change. In the term of General namelist variables, we set start frame at “1”, the final frame at “5000”, the interval as 20 the temperature at 310k.

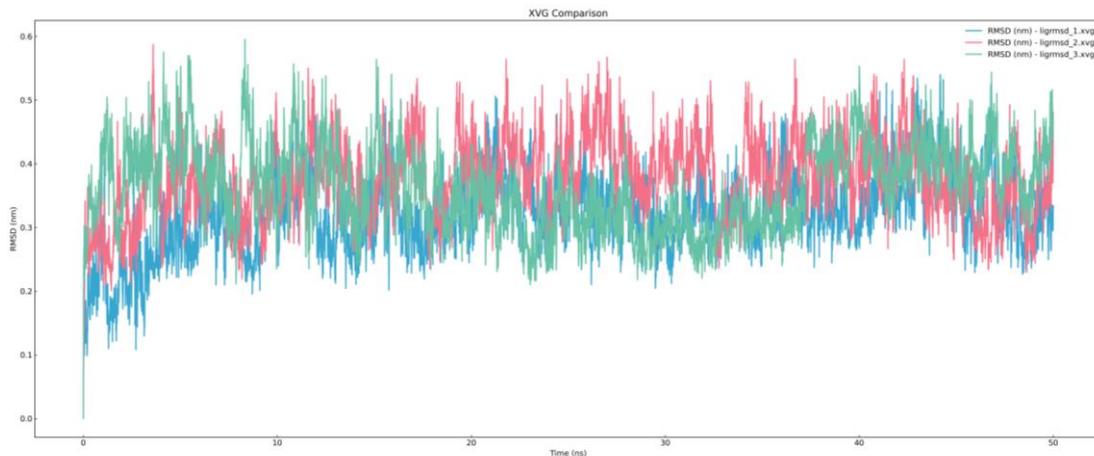

Figure S1. Ligand-RMSD comparison of three-time molecular dynamics simulation.

3. Biology Experimental section

3.1 Expression and purification of recombinant HIV-1 RTs.

His-tagged p66/p51 HIV-1 RT group M subtype B coded in a p6HRT-prot plasmid was expressed in the Escherichia coli strain M15.¹ Heterodimeric RTs were expressed essentially and purified as described.² E. coli cells harboring the expression vector were cultured until reaching an optical density at 600 nm of 0.7. Induction of protein expression was achieved by treating the cells with 1.7 mM isopropyl β-D-1-thiogalactopyranoside (IPTG) for a duration of 4 hours. The subsequent purification of the protein was performed using a BioLogic LP system (BioRad) employing a combination of immobilized metal affinity chromatography and ion exchange chromatography.

To initiate the purification process, the cell pellets were resuspended in lysis buffer at a ratio of 1:2 (cell pellet volume: lysis buffer volume). The lysis buffer used consisted of 50 mM sodium phosphate buffer with a pH of 7.8, supplemented with 0.5 mg/ml lysozyme. The resuspended cells were incubated on ice for 20 minutes. Following this, NaCl was added to achieve a final concentration of 0.3 M. The cells were then subjected to sonication, with four cycles of 60 seconds each, alternating between one second on and one second off. Subsequently, the cell lysate was centrifuged at 30, 000×g for 1 hour.

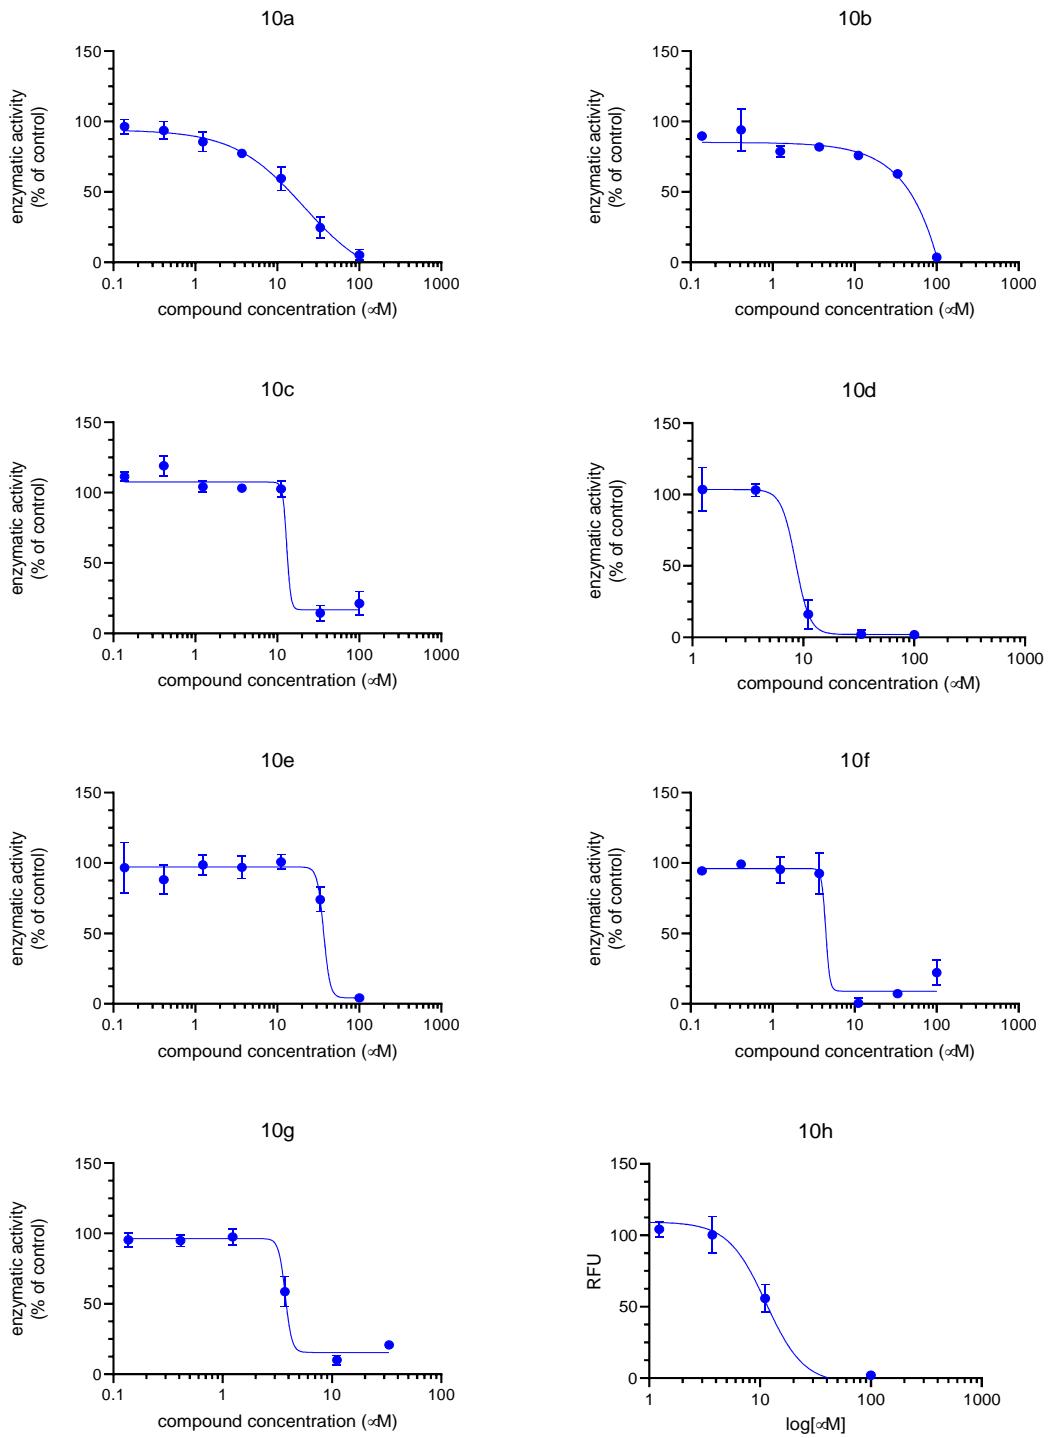

The supernatant obtained from the centrifugation step was loaded onto a Ni²⁺-NTA-Sepharose column that had been pre-equilibrated with a loading buffer consisting of 50 mM sodium phosphate buffer (pH 7.8), 0.3 M NaCl, 10% glycerol, and 10 mM imidazole. The column was washed with a buffer containing 50 mM sodium phosphate buffer (pH 6.0), 0.3 M NaCl, 10% glycerol, and 80 mM imidazole. The target protein, RT, was eluted using an imidazole gradient ranging from 0.08 M to 0.5 M in the wash buffer. Fractions containing the enzyme were collected and combined, and then diluted 1:1 with 50 mM sodium phosphate buffer (pH 7.0) containing 10% glycerol. The diluted protein sample was loaded onto a Hi-trap heparin HP column that had been pre-equilibrated with 10 column volumes of a loading buffer consisting of 50 mM sodium phosphate buffer (pH 7.0), 10% glycerol, and 150 mM NaCl. The column was washed with the loading buffer, and the RT enzyme was eluted using Elute Buffer 2, which

comprised 50 mM sodium phosphate buffer (pH 7.0), 10% glycerol, and 1 M NaCl. The eluted fractions containing the purified protein were collected, and the protein was subsequently dialyzed and stored in a buffer composed of 50 mM Tris-HCl (pH 7.0), 25 mM NaCl, 1 mM EDTA, and 50% glycerol. The catalytic activities of the purified protein samples were determined, and aliquots were stored at -80 °C for further use.

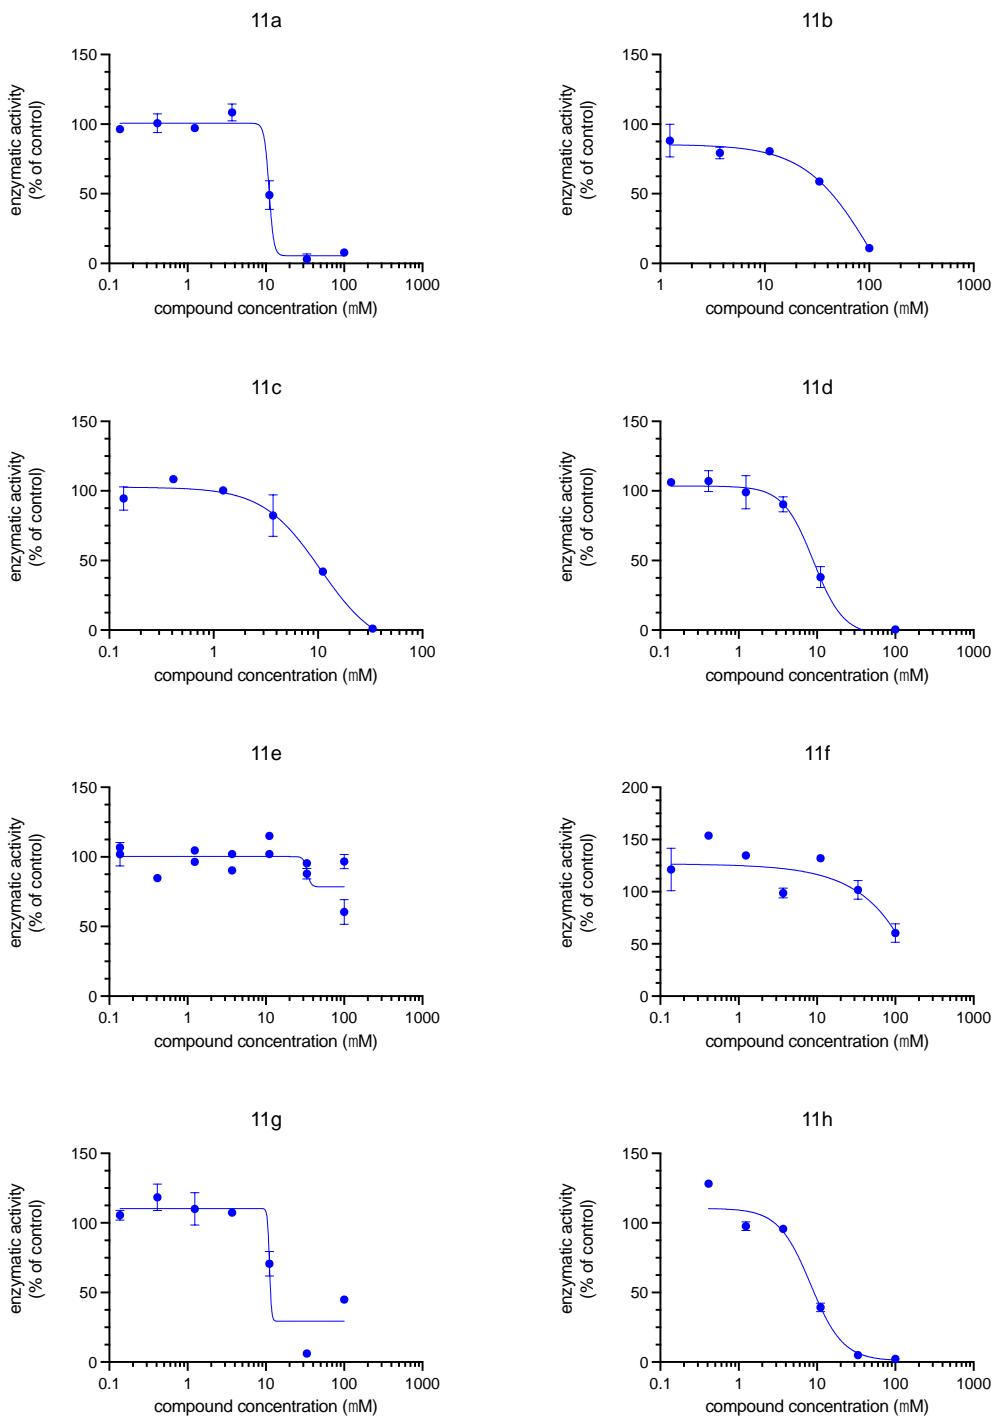

3.2 RNase H Polymerase-Independent Cleavage Assay

The HIV-1 RT-associated RNase H activity was measured as described.³ In summary, the reaction was performed in a black 96-well plate with a total volume of 100 µL. The reaction mix consisted of 50 mM Tris HCl (pH 7.8), 6 mM MgCl₂, 1 mM dithiothreitol (DTT), 80 mM KCl, and 250 nM hybrid RNA/DNA substrate (50-GTTTCTTTCCCCCTGAC-30-Fluorescein, 50-CAAAAGAAAAGGGGGGACUG-30-Dabcyl). Serial dilutions of compounds were added to the reaction mix. The reaction was initiated by adding 20 ng of HIV-1 wt RT, 20 ng of R448A RT, 20 ng of K451A RT, 40 ng of K540 RT, 60 ng of Q475A RT, 500 ng of N474A RT, 500 ng of Y501A RT, and 500 ng of W535A RT. The reaction mixture was then incubated at 37 °C for 1 hour. The products of the reaction were quantified using a Perkin-Elmer Victor 3 multilabel counter plate reader, with excitation and emission wavelengths set at 490/528 nm. The experiments were performed in duplicate and replicated at least two times to ensure reliability. The data obtained were analyzed according to the described methodology.⁴ Dose response curves were fitted to a nonlinear regression of (log10) dose vs normalized response-variable slope. Assay quality was assessed using the Z'-factor calculation with Z' > 0.5 as the threshold for acceptance. Mean ± standard deviation of IC₅₀ values were determined, and p values were calculated between the IC₅₀ value against the wt and IC₅₀ value against the mutants by paired, two-tailed *t* tests using GraphPad Prism 6.01 software (GraphPad Software, Inc.; San Diego, CA). Figures were made with GraphPad Prism 6 version 6.01.

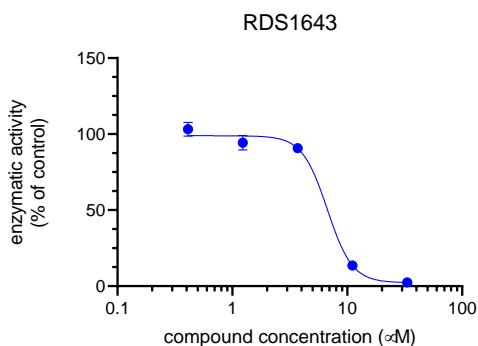

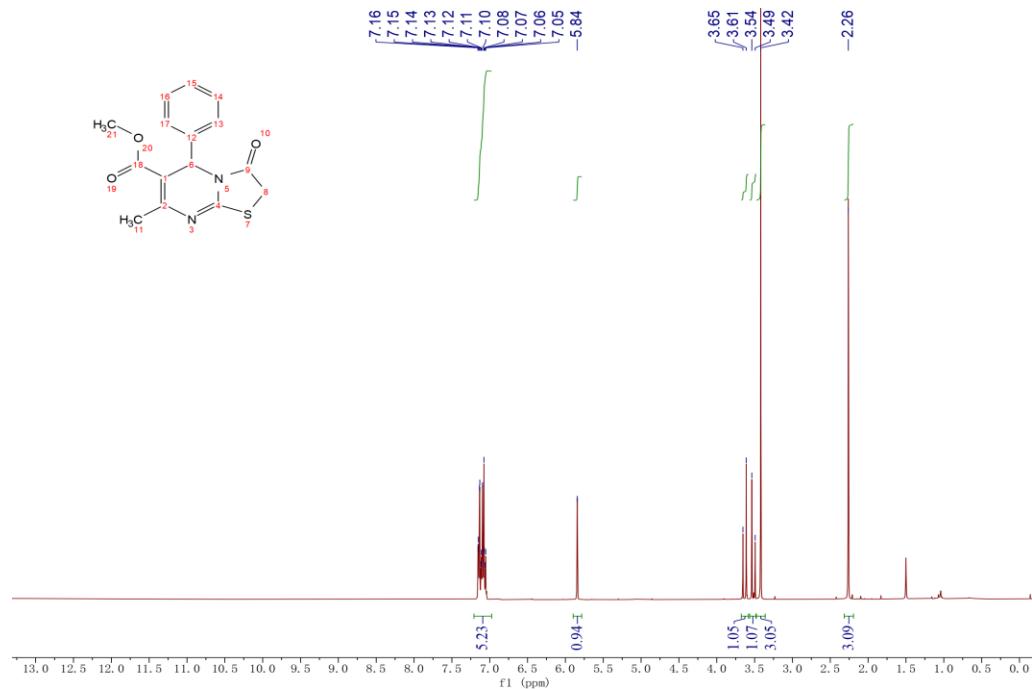

Figure S2. Inhibitory profile of compounds on HIV-1 RNase H activity. Panels A, B and C show the inhibitory profile of tested compounds, results represent the mean percentage \pm sd of enzymatic activity calculated with respect to the control in presence of indicated concentration of compound. Experiments were performed in triplicate with at least three replicates per concentration. D panel shows the inhibitory profile of RDS1643 used as positive control

4. Magnesium Complexation

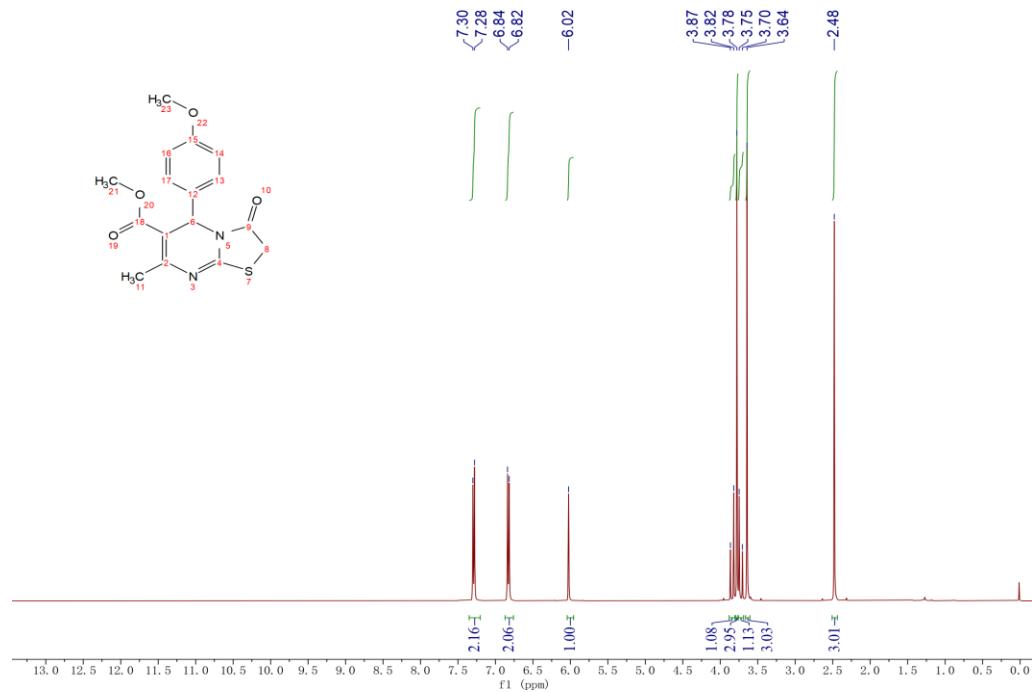

Complexation assays with Mg^{2+} were carried out on compounds **12b**. The effects of the Mg^{2+} were evaluated by a spectrophotometric method, using the UV Spectrophotometer Lambda 1050+ and a Hellma quartz cuvette with a 1 cm optical path. $\text{MgCl}_2 \cdot 6\text{H}_2\text{O}$ was purchased from Aladdin Company. In the experimental study of the binding of compound **12b** with Mg^{2+} , we prepared solvent with a volume ratio of EtOH:dioxane:water = 1:1:1. We prepared 1000ml of this solvent and then weighed 25.75 mg of compound **12b** and dissolved it in the solvent. We take 500 mL of the solution and add magnesium chloride to achieve Mg^{2+} concentration of 10^{-3} M. Each cuvette contained 3ml solution, and the UV-vis spectrum was recorded between 150 and 600 nm.

Compound 12d

Acq. Operator : BY Seq. Line : 28
Acq. Instrument : 1260R Location : 30
Injection Date : 4/12/2024 7:34:39 AM Inj : 1
Inj Volume : 20.000 μ l
Acq. Method : D:\Data\ZXD\DATA\20240411-ZXD-1\zxd-1F_LC 2024-04-12 00-07-33\20240316--ZK-
15MIN-35-95ACN.M
Last changed : 4/12/2024 12:05:51 AM by BY
Analysis Method : D:\DATA\KUN\METHOD\20240204-ZK-15MIN-25-90ACN.M
Last changed : 4/12/2024 4:50:25 PM by BY
(modified after loading)
Method Info : 90% H₂O and 10% ACE

Additional Info : Peak(s) manually integrated

=====
Area Percent Report
=====

Sorted By : Signal
Multiplier : 1.0000
Dilution : 1.0000
Do not use Multiplier & Dilution Factor with ISTDs

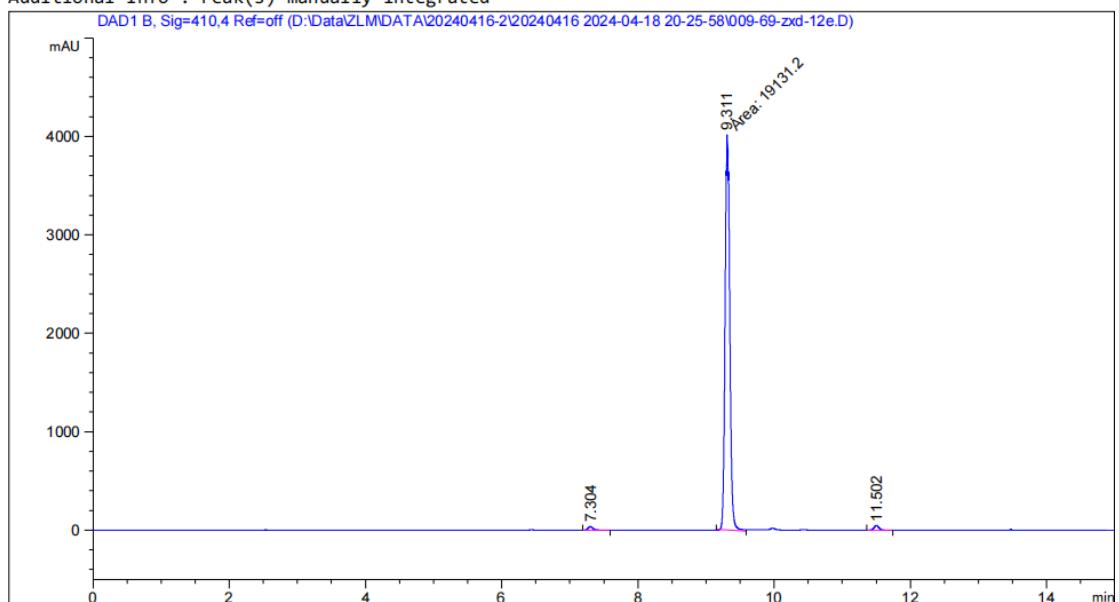

Signal 1: DAD1 B, Sig=410,4 Ref=off

Peak #	RetTime [min]	Type	Width [min]	Area [mAU*s]	Height [mAU]	Area %
