Metformin prevents key mechanisms of obesity-related complications in visceral white adipose tissue of obese pregnant mice

Katrin Schmitz, Eva-Maria Turnwald, Tobias Kretschmer, Ruth Janoschek, Inga Bae-Gartz, Kathrin

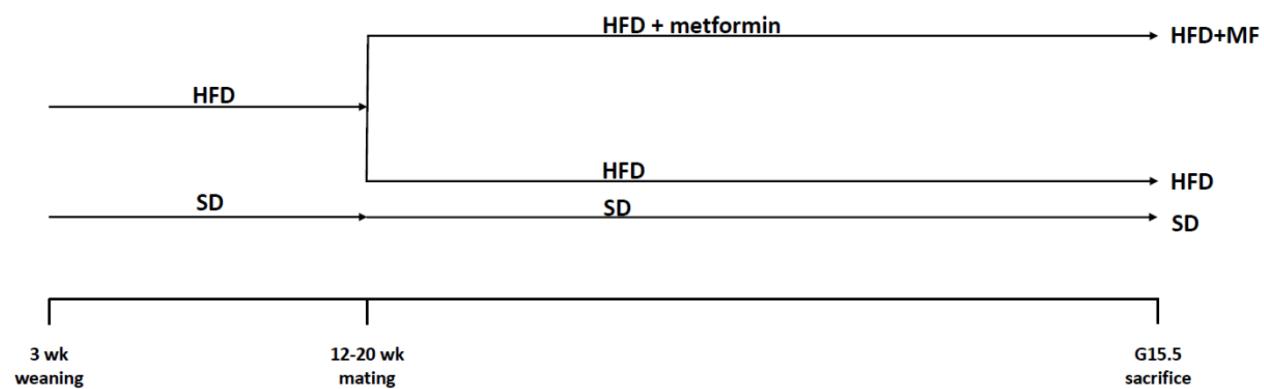

Figure S1. Schematic overview of the mouse groups used in this study. Female mice received either a SD or HFD after weaning until mating. After mating, the control group continued to receive the SD until the end of the experiment. The HFD group was randomly split in two subgroups after mating, while one subgroup continued to feed on HFD until sacrifice at G15.5 (HFD), and one subgroup received HFD plus metformin until G15.5 (HFD + MF). SD = standard diet; HFD = high fat diet; MF = metformin; G = gestational day; wk = week.

Table S1. Details on mouse diets used in this study. ME = metabolizable energy; SD = standard diet; HFD = high fat diet.

	SD	HFD
Company	Ssniff (Soest, Germany)	Altromin (Lage, Germany)
Catalog number	V1534 – R/M-Maintenance	C1057, modified
Metabolizable energy [kcal/kg]	3225	5237
Fat [% of ME]	9	60
Protein [% of ME]	33	16
Carbohydrates [% of ME]	58	24

Summary tables from proteomic screen of pgWAT at the middle of last trimester

Proteins named in the discussion are highlighted in each table.

Table S2: Significantly and relevantly upregulated proteins in pgWAT at G15.5 in HFD vs SD. 53 proteins are significantly (qvalue < 0.05) and relevantly (fold change > 1.5) upregulated in obese (HFD) compared to lean dams (SD). Protein ID, protein name, gene, q-value (p-value corrected for multiple testing), fold change and valid values of both groups (= number of samples in which a protein was detected) are shown. The table is sorted according to fold change. 5 samples were analyzed per group.

Table S4: Significantly and relevantly upregulated proteins in pgWAT at G15.5 in HFD+MF vs HFD. 58 proteins are significantly (q-value < 0.05) and relevantly (fold change > 1.5) upregulated in obese dams treated with metformin during pregnancy (HFD+MF) compared to obese dams (HFD). Protein ID, protein name, gene, q-value (p-value corrected for multiple testing), fold change and valid values of both groups (= number of samples in which a protein was detected) are shown. The table is sorted according to fold change. 4 HFD+MF samples and 5 HFD samples were analyzed.
