Materials and Methods

Anthropometric evaluation

The anthropometric evaluation included measurements of height (cm) and weight (kg), used for the Body Mass Index (BMI) calculation (kg/m^2). BMI was calculated by the ratio of weight in kilograms and height in meters squared: normal range (normal-weight condition) was considered $18.5\text{-}24.99 \text{ kg}/\text{m}^2$, the range for overweight was $25\text{-}29.99 \text{ kg}/\text{m}^2$, for obesity class I was $30\text{-}34.99 \text{ kg}/\text{m}^2$, for obesity class II was $35\text{-}39.99 \text{ kg}/\text{m}^2$ and for obesity class III greater than or equal to $40 \text{ kg}/\text{m}^2$.

Lifestyle factors assessment

The MDS score, including 11 food groups, assigns an increasing score from 0 to 5, based on the monthly or weekly consumption of foods typical of the Mediterranean diet (unrefined cereals, potatoes, vegetables, fruit, legumes, fish and olive oil) and a decreasing score from 5 to 0, based on the monthly consumption of foods not included in the same dietary model (meat or derivatives, poultry, whole dairy products); for alcohol consumption, decreasing scores from 5 to 1 correspond respectively to a consumption $<300 \text{ ml/day}$, $<400 \text{ ml/day}$, $<500 \text{ ml/day}$, $<600 \text{ ml/day}$, while a score of 0 corresponds to a consumption $> 700 \text{ ml/d}$ or no consumption. The total score, obtained from the sum of the 11 individual scores (one for each food group), ranges from 0 to 55, where higher values indicate greater adherence to MD [1].

State of cognition was assessed through the MMSE questionnaire. The score ranges from 0 to 30, with higher scores corresponding to better cognitive functioning [2]. However, in the assessment of the elderly population, the score must be appropriate to the age group and level of education [3].

The ability of each subject to carry out the daily life activities independently was measured through the ADL questionnaire. If the person is unable to carry out any activity, he/she is considered functionally incapable (ADL dependent) [4].

Nutritional status in older people was measured using the MNA questionnaire. It is an 18-item questionnaire that consists of a two-step procedure: the MNA-SF (6 elements) to screening malnutrition and its risk and the complete MNA to assess nutritional status. The questionnaire includes anthropometric measurements combined with information on diet, lifestyle, medications, the presence of acute stress, dementia or depression and a self-perception of health and nutrition. It correlates with clinical indicators of nutritional status (albumin level, BMI, energy intake and vitamin status). A score ≥ 24 corresponds to a normal nutritional status, a score ≤ 17 identifies malnourished subjects, while subjects with a score between 17 and 23.5 are at risk of malnutrition [5,6].

The level of daily physical activity in the elderly was assessed through the PASE questionnaire. It consists of 12 elements that evaluate the duration, frequency, extent of exertion and the amount of physical activity performed over a seven-day period by individuals aged 65 and over. In particular, the questionnaire evaluates the activities typically chosen by the elderly, such as walking, recreational activities, exercise, housework, gardening and caring for others. The score (from 0 to 793) is calculated based on the frequency, duration and level of intensity of the activity compared to that of the previous week; higher scores indicate greater physical activity [7].

Table S1 Alpha diversity analysis between CENT, NON and CTLs and between CPAR and COFF

Shannon index	Mean (SD)	overall <i>p</i>	Bonferroni <i>p</i> (CENT vs NON)
		0.037	0.020
CENT	2.39 (0.31)		
NON	2.46 (0.29)		
CTLs	2.32 (0.2)		
		0.398	
CPAR	2.40 (0.29)		
COFF	2.29 (0.19)		

Differences in the Shannon index between CENT, NON and CTLs, evaluated by Kruskal-Wallis test in SPSS software v.28.0.1.0 followed by Bonferroni correction for multiple comparisons. CENT= centenarian subjects, NON= nonagenarian subjects, CTLs= healthy younger controls. CPAR=centenarian parents, COFF=centenarians' offspring. Bold values denote statistical significance ($p \leq 0.05$).

Table S2 GM beta diversity analysis between CENT, NON and CTLs

Beta diversity	overall <i>p</i>	PERMANOVA pairwise <i>p</i> (CENT vs CTLs)	PERMANOVA pairwise <i>p</i> (NON vs CTLs)	PERMANOVA pairwise <i>p</i> (CENT vs NON)
	0.001	0.006	0.003	n.s.
CENT				
NON				
CTLs				
Degrees of freedom	2			
Sum squares	1.498			
Mean squares	0.749			
F	6.074			
R²	0.1201			

Differences in the beta diversity index between CENT, NON and CTLs were evaluated by Permutational Multivariate Analysis of Variance (PERMANOVA) performed in R (RVAdeMemoire package). CENT= centenarian subjects, NON= nonagenarian subjects, CTLs= healthy younger controls. Bold values denote statistical significance ($p \leq 0.05$); n.s.= not significant. Pairwise PERMANOVA test confirmed significant segregation in the comparison between LLS groups and CTLs.

Table S3 GM beta diversity analysis between CPAR and COFF

Beta diversity		PERMANOVA pairwise <i>p</i>					
		1					
CPAR							
COFF							
Degrees of freedom	1						
Sum of squares	0.08						
Mean of squares	0.08						
F	0.706						
R²	0.056						

Differences in the beta diversity index between CPAR and COFF were evaluated by Pairwise Permutational Multivariate Analysis of Variance (Pairwise PERMANOVA) performed in R (RVAdemoir package). CPAR=centenarian parents, COFF=centenarians' offspring. Bold values denote statistical significance ($p \leq 0.05$).

Table S4 29 Statistically significant common differences in the relative abundance of bacterial taxa in the two classes of LLS compared to CTLs

Table shows the 41 GM significant differences observed only from the comparison between NON and CTLs, performed by Kruskal-Wallis test on R software v.3.5.2. Pairwise comparison was performed only for significant taxa, followed by Bonferroni correction for multiple comparisons. p equal to or less than 0.05 was considered statistically significant. CENT= centenarian subjects, NON= nonagenarian subjects, CTLs= healthy younger controls, ↓= significantly reduced in NON, ↑= significantly increased in NON.

Table S7 8 Statistically significant divergences in the relative abundance of bacterial taxa observed from the comparison between CENT and NON
