

Figure S1. Interindividual variability of proteomic responses to ZIKV challenge per study group. Spearman correlation was performed between cytokine concentrations from each macaque within each group (naïve: Q10 and Q9; subcutaneous ZIKV challenge: Q8 and Q7; vaginal ZIKV challenge: R15 and R14; uninfected following vaginal ZIKV challenge: R7 and R6) measured in culture supernatants from colorectal, vaginal, cervical and uterine tissue explants.
