	Reproductive Organs																(+)			
	Skin						++									++		+++	+	

¹*C. perfringens*, *Clostridium perfringens*; ²*Coryne. auriscanis*, *Corynebacterium auriscanis*; ³*Enteroc. faecalis*, *Enterococcus faecalis*; ⁴Fungi, not further identified; ⁵ include *Buttiauxella* spp., *Leclercia* spp., *Pantoaea* spp., *Rahnella* spp., *Raoultella* spp., *Serratia* spp.; ⁶*S. pseudintermedius*, *Staphylococcus pseudintermedius*; ⁷Coag.-neg. staph., coagulase negative staphylococci;

⁸*Strep. canis*, *Streptococcus canis*

Table S2: Biological data and pathological findings of the five investigated raccoon dogs presented with sarcoptic mange

Biological data				Pathological findings	
Animal	Sex	Age	Nutritional status	Gross	Histopathology
Raccoon dog 1 (Np1)	M	juvenile	Not assessable	Skin: Alopecia with severe lichenification, crust formation and hyperpigmentation of the skin; Ectoparasitosis, mild (ticks and louse flies)	Skin: Epidermal hyperplasia and hyperkeratosis, diffuse, severe, with mild eosinophilic dermatitis and numerous intracorneal mites; Tonsils: Follicular hyperplasia, mild; Retropharyngeal lymph node: Follicular hyperplasia, severe; Lung: Bronchopneumonia, necrosuppurative, multifocal,, acute, mild; Pulmonary lymph node: Follicular hyperplasia, severe; Liver: Hepatolipidosis, diffuse, mild; Spleen: Follicular hyperplasia, mild; Intestine: Enteritis, lymphocytic, multisegmental, chronic, mild; Mesenteric lymph node: Follicular hyperplasia, severe; Peyer's patches : Follicular hyperplasia; Inguinal lymph node: follicular hyperplasia, severe
Raccoon dog 2 (Np2)	F	adult	Good	Skin: Alopecia with severe lichenification, crust formation and hyperpigmentation of the skin; Ectoparasitosis, mild (ticks) Intestine: Endoparasitosis, mild (nematodes); Catarrhal enteritis, segmental, acute, mild.	Skin: Epidermal hyperplasia and hyperkeratosis, diffuse, mild, with mild eosinophilic dermatitis and single intracorneal mites; Nasal mucosa: Rhinitis, suppurative and necrotizing, focal, subacute, mild, with intralesional foreign material; Retropharyngeal lymph node: Follicular hyperplasia, mild; Lung: Pneumonia, bronchointerstitial, lymphohistiocytic, diffuse, chronic, mild, with multifocal involvement of eosinophil granulocytes; airway smooth muscle hypertrophy, diffuse, moderate; Mesenteric lymph node: Follicular hyperplasia, severe; Peyer's patches: Follicular hyperplasia, severe
Raccoon dog 3 (Np3)	M	juvenile	Poor	Skin: Alopecia with severe lichenification, crust formation and hyperpigmentation of the skin; Ectoparasitosis, severe (ticks); Intestine: Endoparasitosis, moderate (nematodes); Catarrhal enteritis, segmental, mild	Skin: Epidermal hyperplasia and hyperkeratosis, diffuse, severe, with mild eosinophilic dermatitis and numerous intracorneal mites; Lung: Bronchopneumonia, suppurative, multifocal, subacute, mild; Airway smooth muscle hypertrophy, diffuse, moderate; Intestine: few intraluminal nematodes, Peyer's patches plates: Follicular hyperplasia, mild

(continued)

Biological data				Pathological findings	
Animal	Sex	Age	Nutritional status	Gross	Histopathology
Raccoon dog 4 (Np4)	M	juvenile	Not assessable	Skin: Alopecia with severe lichenification, crust formation and hyperpigmentation of the skin; Ectoparasitosis, severe (ticks, louse flies; skin scraping during necropsy showed numerous mites (morphologically consistent with <i>Sarcoptes</i> spp.); Intestine: Endoparasitosis, mild (nematode); Catarrhal enteritis, segmental, mild	Skin: Epidermal hyperplasia and hyperkeratosis, diffuse, severe, with mild eosinophilic dermatitis and numerus intracorneal mites; Retropharyngeal lymph node: Follicular hyperplasia, severe; Lung: Bronchopneumonia, suppurative, multifocal, subacute, moderate; Liver: Hepatitis, necrotizing, (sub)acute, mild; Spleen: hyperplasia of the red and white pulp, moderate; Peyer's patches: Follicular hyperplasia, severe; Bone marrow: Trilinear hyperplasia
Raccoon dog 5 (Np5)	M	adult	Poor	Skin: multifocal thinning of the haircoat; Ectoparasitosis, mild (ticks); Intestine: Endoparasitosis, mild (cestdodes)	Skin: Epidermal hyperplasia and hyperkeratosis, diffuse, severe, with mild eosinophilic dermatitis and numerous intracorneal mites; Tonsils: Follicular hyperplasia, moderate; Retropharyngeal lymph node: Follicular hyperplasia, mild; Trachea: Calcification of the cartilage, mild; Lung: Pneumonia, bronchointerstitial, lymphoplasmacytic and eosinophilic, diffuse, chronic, mild, ; Liver: Hepatitis, necrotizing, multifocal, acute, moderate; Stomach: Follicular gastritis, multifocal, chronic, moderate; Spleen: hyperplasia of the red and white pulp, mild; Intestine: Enteritis, mostly eosinophilic , segmental, acute, mild; Kidney: Fibrosis, interstitial, focal, chronic, severe; Aortic lymph node: Follicular hyperplasia, severe; Inguinal lymph node: Follicular hyperplasia, severe; Bone marrow: Trilinear hyperplasia
