- **Table S2.** QSAR Predicted pIC₅₀ values, docking scores, docking ranks and protein-ligand interactions of 142 Hits
- **Table S3.** 3D-structures of selected hits
- **Table S4.** The predicted activities of thirty-two compounds (Test set 2)
- **Figure S4.** The correlation between Actual activities (pIC₅₀) and Predicted activities (\$PRED) of Test set 2 compounds

Procedure of Homology Modeling

The homology model of *Saccharomyces cerevisiae* was generated by SwissModel server (swissmodel.expasy.org). FASTA sequence of *S. cerevisiae* α-glucosidase was taken from UniProtKB (AC: P53341, www.uniprot.org). *S. cerevisiae* isomaltase (PDB ID: 3AXH, Resolution 1.30Å, 72.4 % identity with *S. cerevisiae* α-glucosidase) was used as template. PROCHECK Ramachandran plot [<https://servicesn.mbi.ucla.edu/PROCHECK/>], ERRAT plot [<https://servicesn.mbi.ucla.edu/ERRAT/>] and Verify3D [<https://servicesn.mbi.ucla.edu/Verify3D/>] were used for structural and physicochemical assessment of model. UCSF Chimera [<https://www.cgl.ucsf.edu/chimera/>] was used for the visual analysis. Active site residues, catalytic triad and water molecules involve in protein-ligand bridging were identified by superimposing template structure on the model and sequence alignment. Finally, the model was used in the structure-based screening of 6609 compounds.

Figure S1. The sequence alignment of *S. cerevisiae* α -glucosidase model (P53341) and templates (3AXH and 3A47). The sequence alignment was generated by TCOFFEE (<http://tcoffee.crg.cat/>).

Calculation of Enrichment Factor (EF) and Receiver operating characteristic-curve (ROC-curve)

EF was calculated by following equation:

$$EF = \frac{\text{HITS sampled}/\text{HITS total}}{N \text{ sampled}/N \text{ total}}$$

%EF was calculated by following equation:

$$\%EF = \frac{\text{Enrichment Factor} \times 100}{\text{Ideal Enrichment Factor}}$$

Success was declared when 50% of known α -glucosidase inhibitors (α GIs) were ranked in the top 1% (top 67 compounds), 5% (top 333 compounds) and 10% (top 665 compounds) of screened library. The optimal threshold for virtual screening accuracy was justified by the following criteria: If in top 1%, in top 5% and in top 10% of screened database, all the 38 α GIs are successfully identified then, the ideal EF would be 100, 20 and 10, respectively.

ROC curves differentiate between two populations (active inhibitors and decoy compounds), therefore it is used to evaluate VS performance. ROC curve describes the trade-off between sensitivity (detection of true positives by model) and specificity (ability of model to avoid false negatives). Enrichment is quantified by calculating area under the curve (AUC). If the value of AUC is ≥ 0.9 , the scoring function would be considered as excellent, while the value of $AUC \leq 0.6$ depicts least or no enrichment. The AUC value of 0.93 was observed for MOE, indicating that MOE is performing well in virtual screening. The ROC curve of MOE is shown in Figure S2.

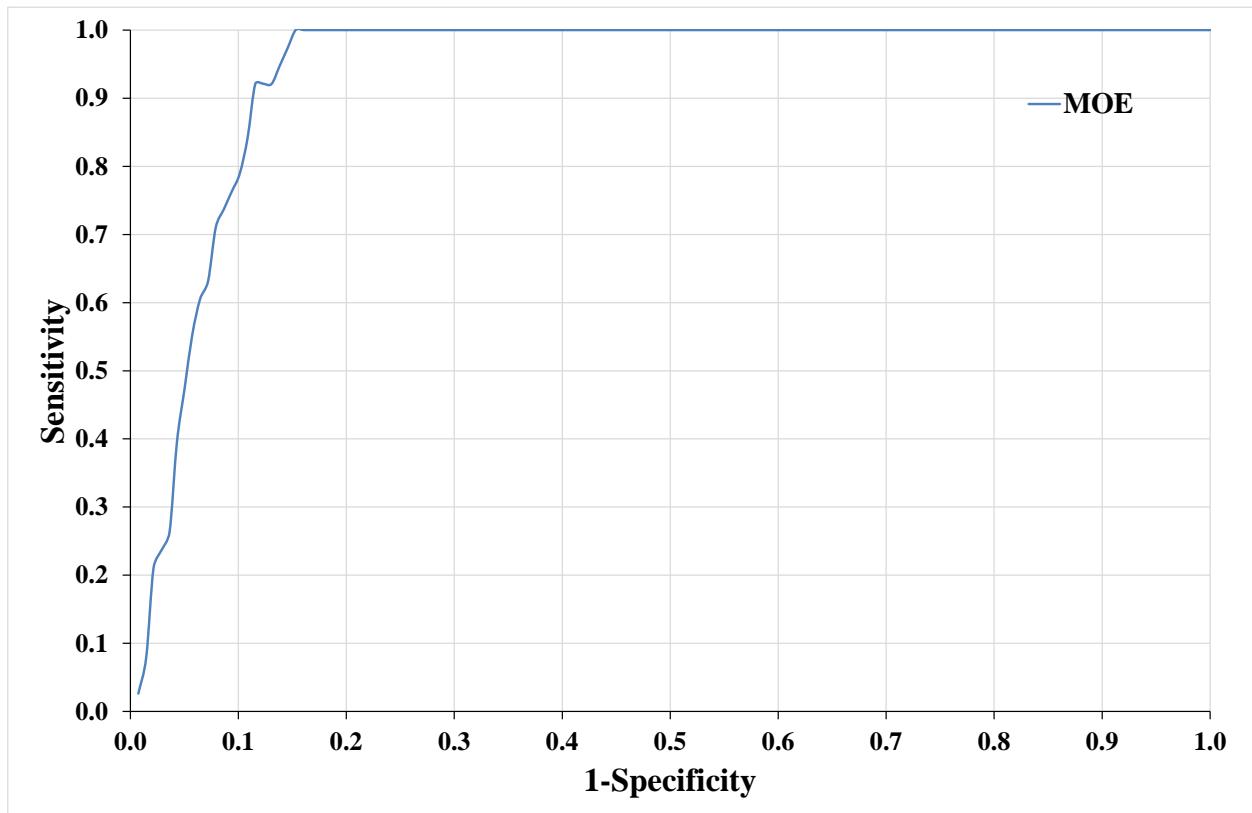

Figure S2. Receiver Operating Curve (ROC) for α -glucosidase obtained from MOE which showed AUC value of 0.94.

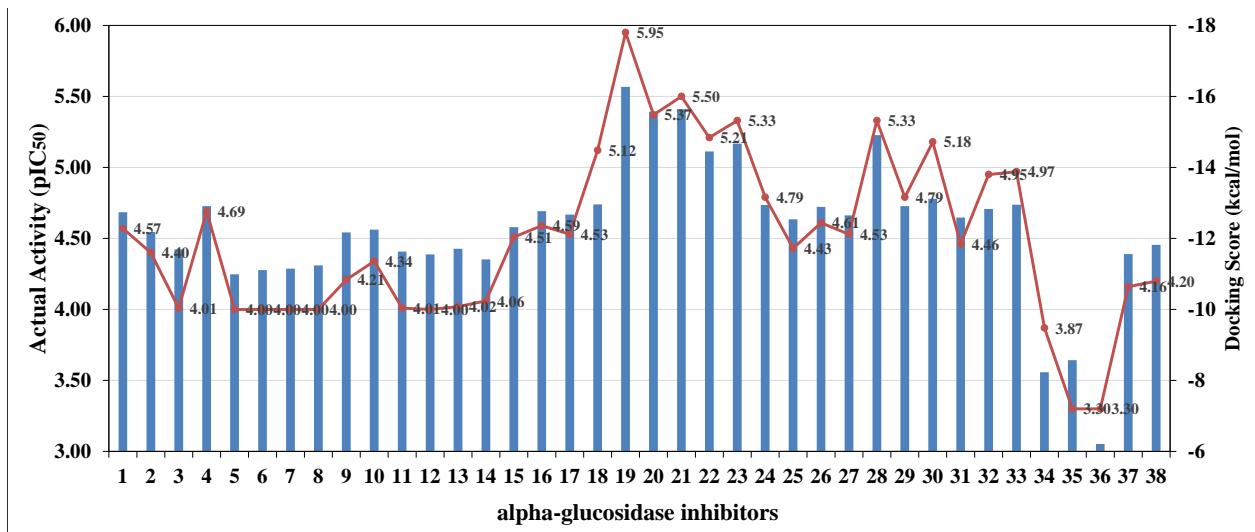

Figure S3. The correlation between Actual activities (pIC₅₀) of known inhibitors (compounds used in QSAR modeling) with their docking scores

Table S1. ADMET Properties of Selected 142 Hits

BBBP: blood brain barrier permeant, HIA: human intestinal absorption, NS: non-substrates, NI: non-inhibitor, Subs: substrate, Inh: inhibitor, AT: AMES toxicity, AOT: acute oral toxicity, SA: synthetic accessibility. The compounds that show excellent pharmacokinetic profile are highlighted with green color.

Table S2. The docking scores, docking ranks and protein-ligand interactions of 142 Hits

Compounds	QSAR Predicted Activity	Docking Rank	ZINC ID	Docking Score	Protein-ligand Interactions
