## 2. Two-photon excited fluorescence (2PEF) data for **1a,b** and **2a,b**

**Figure S8.** Overlay of one- and two-photon absorption spectra for **1a,b** and **2a,b** in toluene (25 °C).

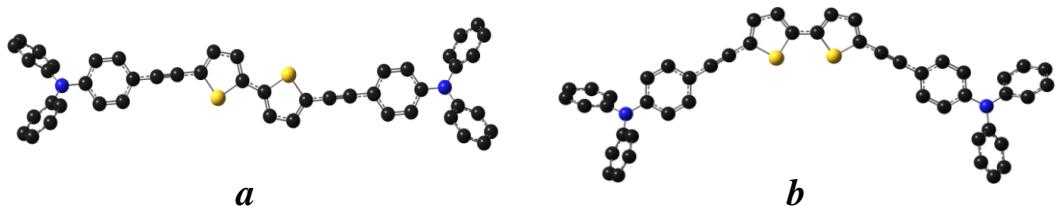

**Figure S9.** Left: quadratic dependence of the emission intensity (F) on laser excitation power (P) for **1a,b** and **2a,b** at their maxima nm in toluene (25 °C). Right: dependence of F on  $P^2$ .

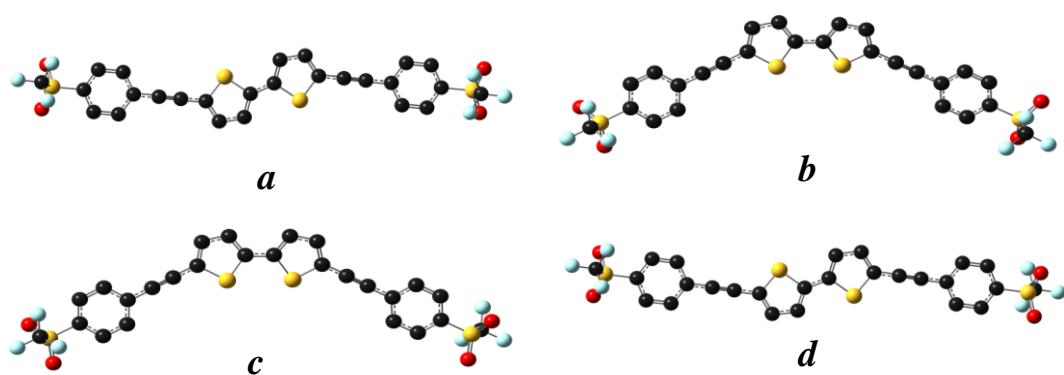

**Figure S9 (continued).** Left: quadratic dependence of the emission intensity ( $F$ ) on laser excitation power ( $P$ ) for **1a,b** and **2a,b** at their maxima nm in toluene (25 °C). Right: dependence of  $F$  on  $P^2$ .

**3. Conformers and conformational freedom at the PBE0/6-31+G(d) level of theory for 1a,b and 2a,b**

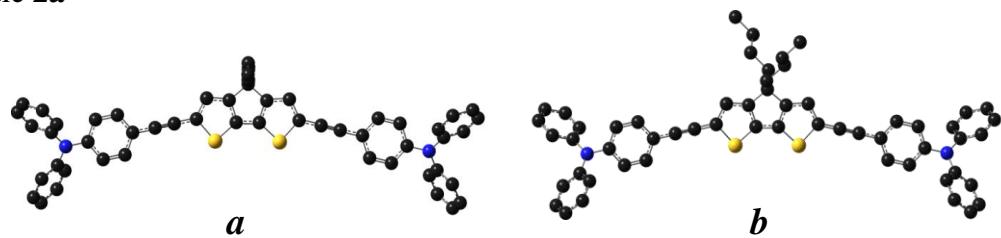

Molecule **1a**

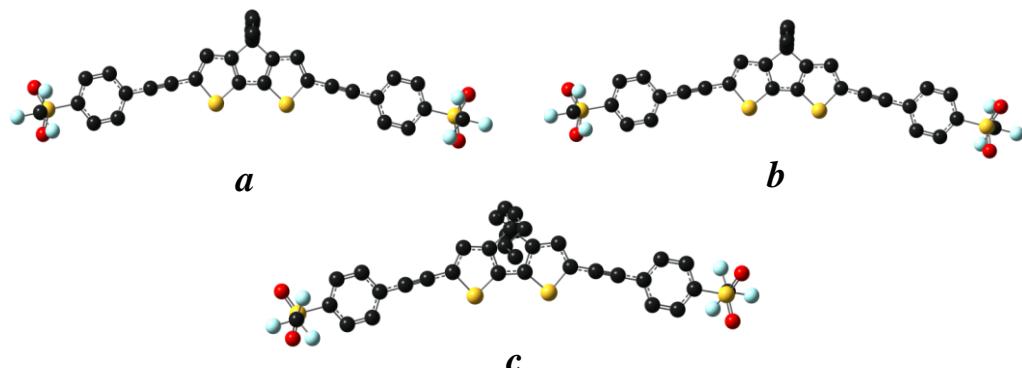

Molecule **1b**

Molecule **2a**

Molecule **2b**

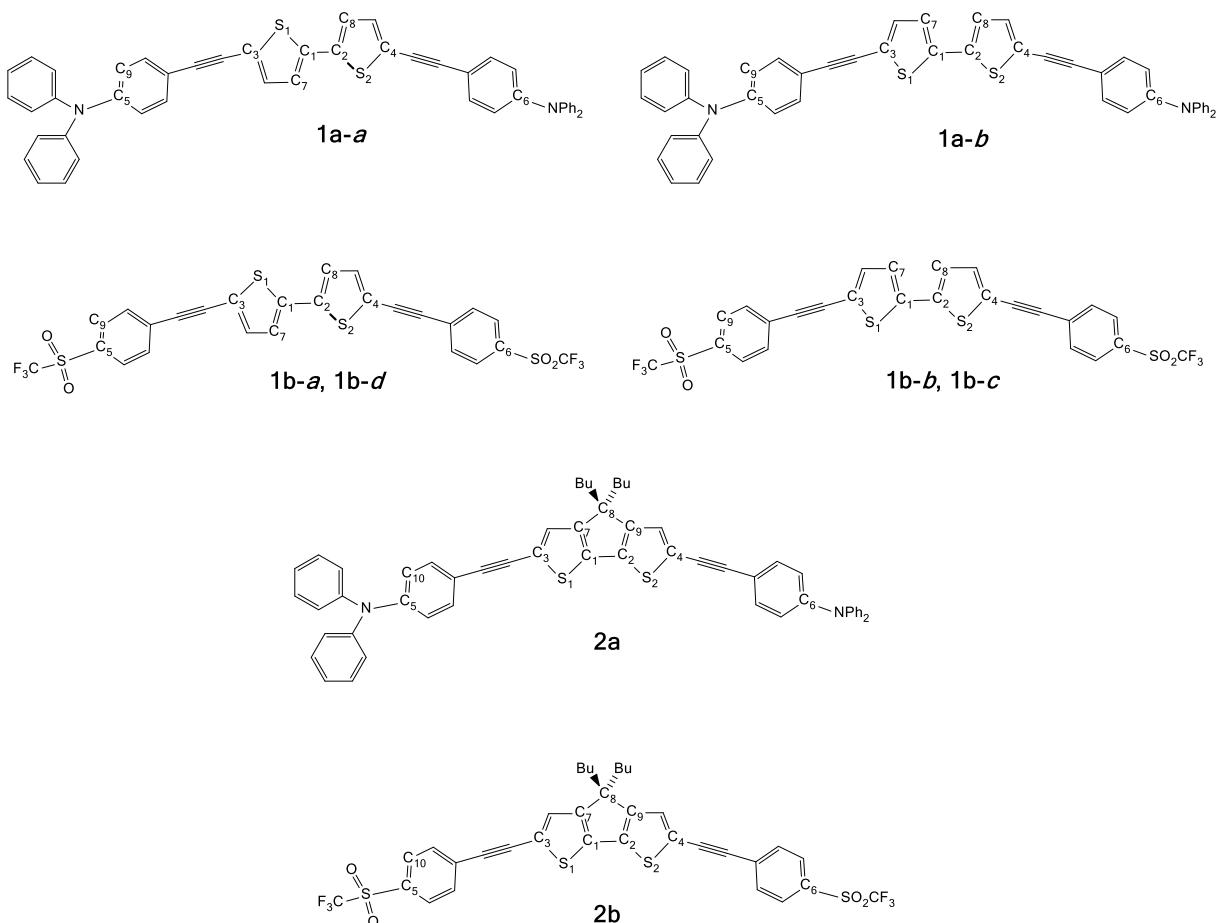

**Figure S10.** PBE0/6-31+G(d)-optimized geometries, using the PCM solvation model in toluene, involving the different configurations of **1a,b**, and **2a,b**. (S, yellow; C, black; H, white; O, red; N, blue; and F, sky blue).

**Table S1.** PBE0/6-31+G(d) relative energies ( $\Delta E$ , kcal.mol<sup>-1</sup>) of the conformers relative to the most stable optimized conformer in level, in toluene.

Compound	<b>1a</b>		<b>2a</b>		<b>1b</b>				<b>2b</b>		
Form	<i>a</i>	<i>b</i>	<i>a</i>	<i>b</i>	<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>	<i>a</i>	<i>b</i>	<i>c</i>
$\Delta E$	0.00	0.80	0.00	0.80	0.00	0.00	0.70	0.70	0.00	0.10	4.30

In the most stable configuration (form *a*) of **2a** and **2b**, the two butyl groups are perpendicular to the plane of the molecule. In the case of **1a** and **1b**, a *trans* arrangement is adopted at the bithiophene units. For **2b**, forms *a* and *b* are very close in energy, differing in the orientation of the triflate ( $\text{SO}_2\text{CF}_3$ ) terminal group. In all of these conformers, the peripheral *para*-substituted phenyleneethynylene arms are coplanar with the bithiophene core. Given their energy differences, all these conformers (apart, perhaps, for isomer *c* of **2b**) should coexist in solution. This is certainly the case for the *cis* and *trans* conformers of **1a** and **1b**.

**Scheme S1.** Atom numbering in the **1a,b** and **2a,b** series of compounds. Hydrogen atoms omitted for clarity.

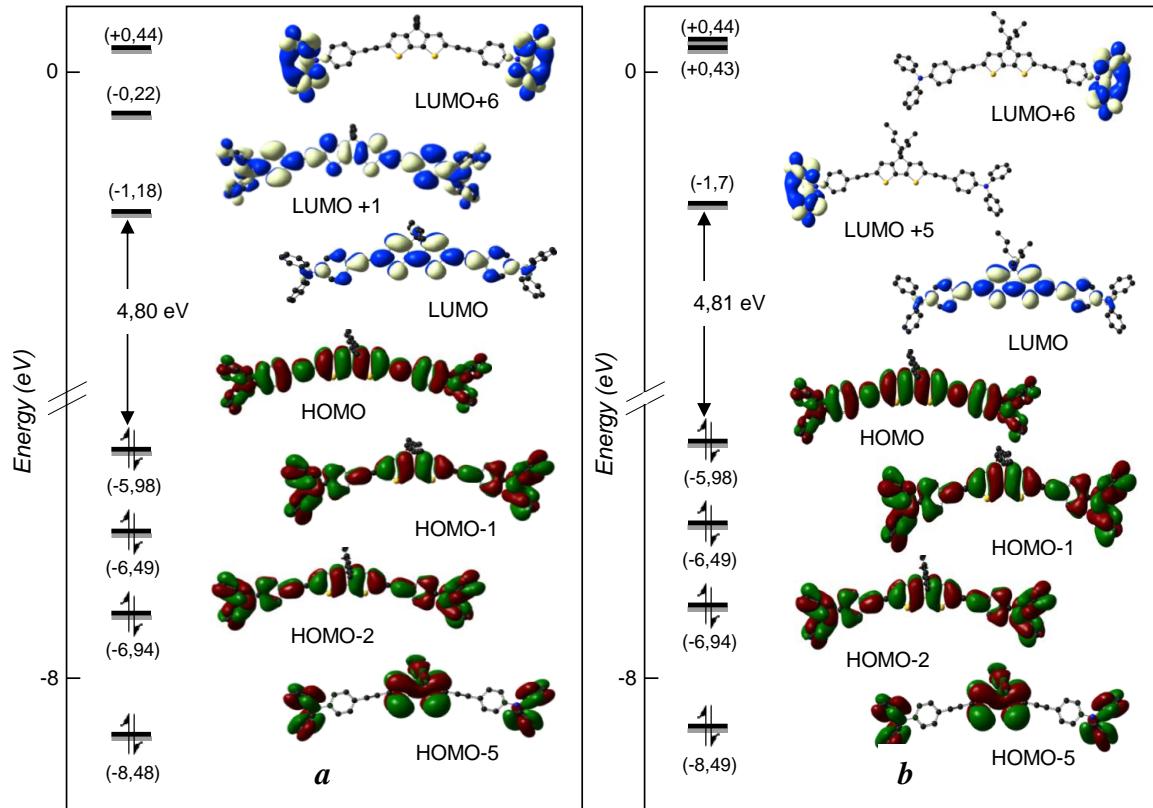

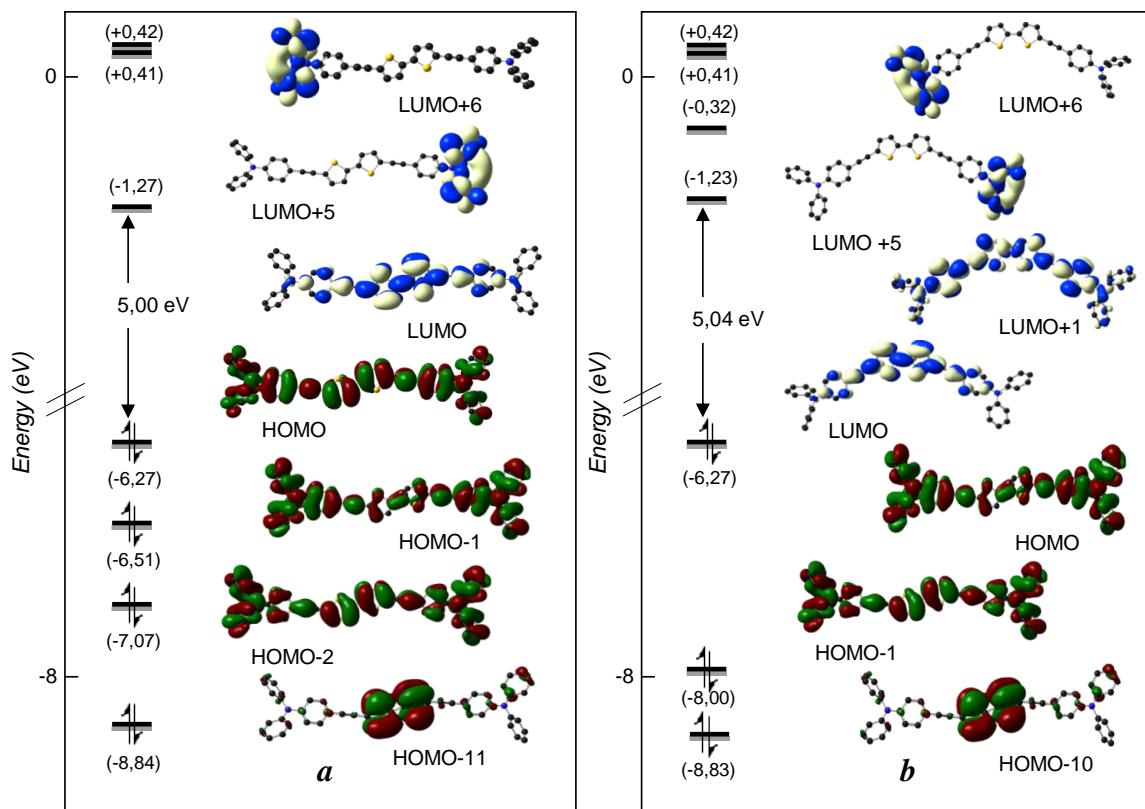

Pertinent calculated important geometrical parameters are presented (below) in Table S2. The data shows that the bond lengths and bond angles remain unchanged in the different conformers of a given compound. Trigonal planar sulfur atoms are observed in all compounds. The bond

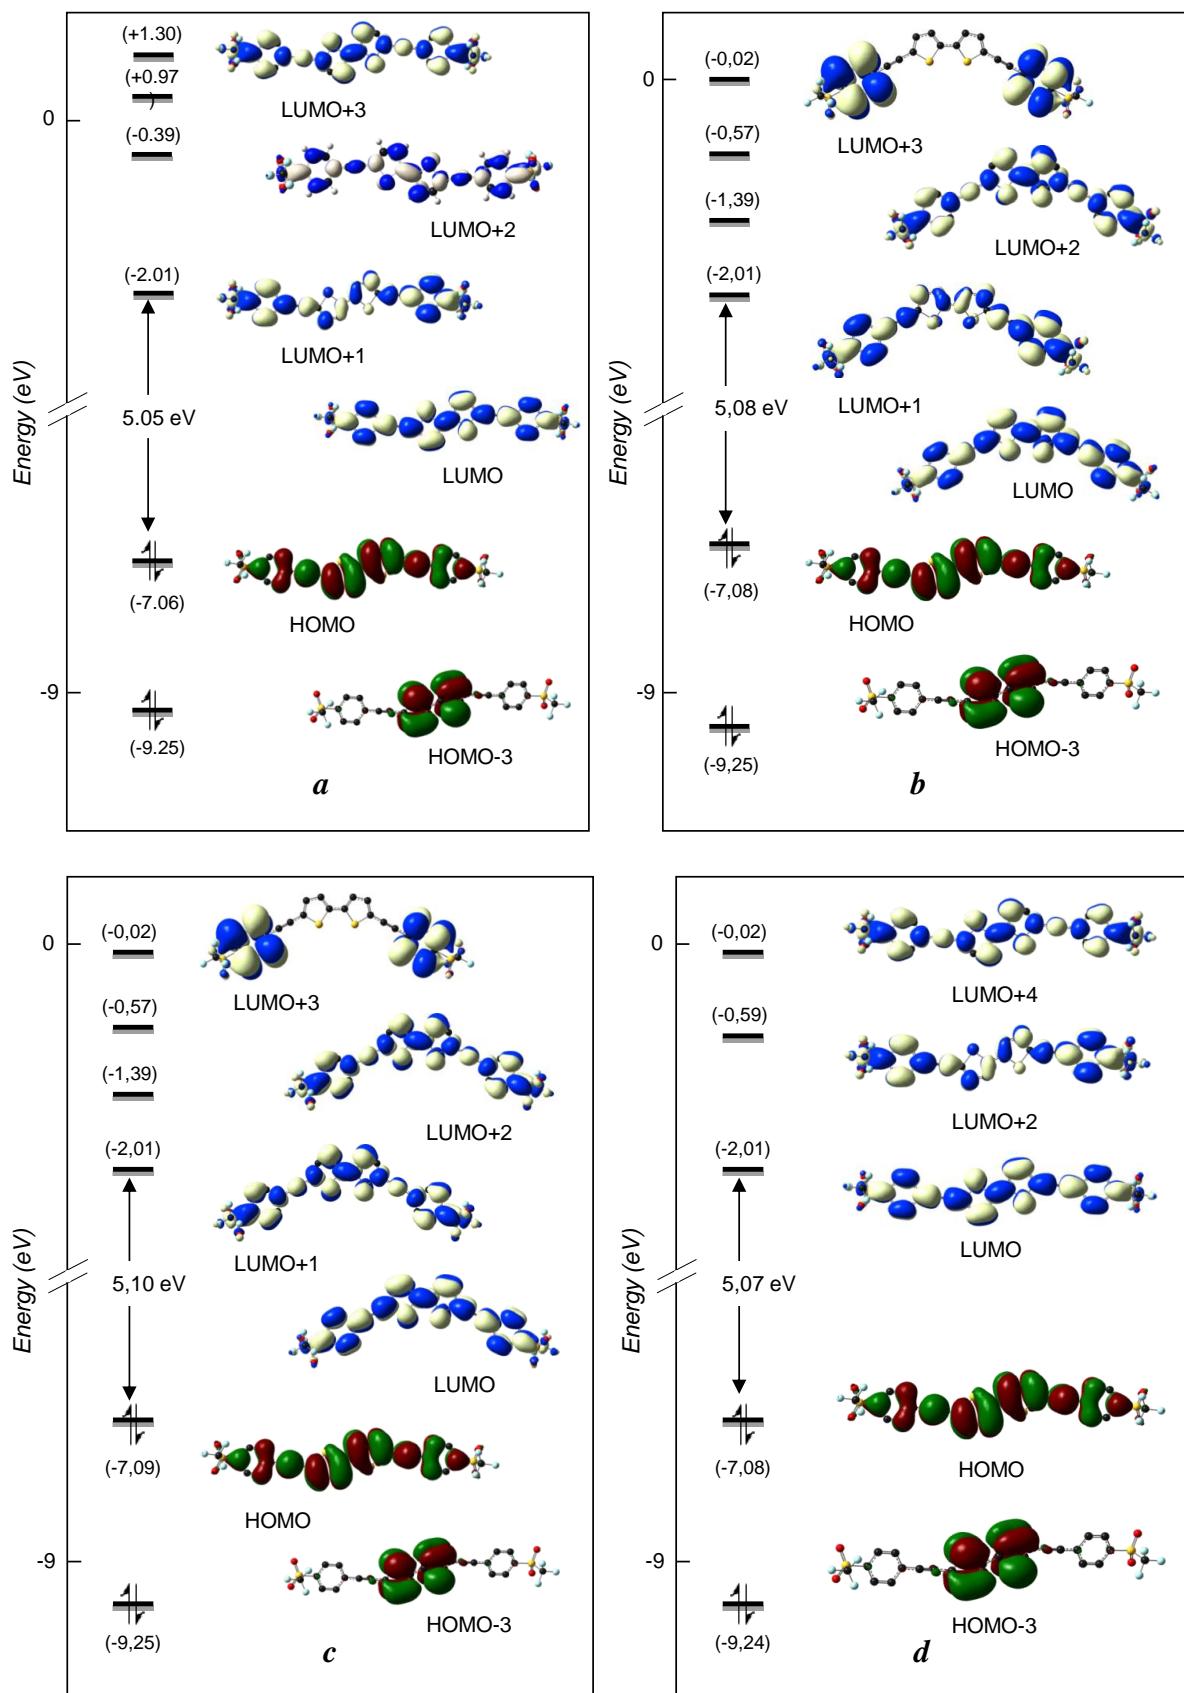

angle at the sulfur is around  $93^\circ$ , the C-C-S angle is around  $109^\circ$  and the other two carbons show a bond angle around  $114^\circ$ . The C-C bonds of the carbons adjacent to the sulfur are about 1.34 Å, the C-S bond length is around 1.70 Å, and the other C-C bond is about 1.41 Å. Different types of dihedral angles are considered to describe the geometry of the considered bi-thiophene derivatives (Scheme S1). These dihedral angles do not vary significantly from a *trans* form to a *cis* form of the thiophene rings.

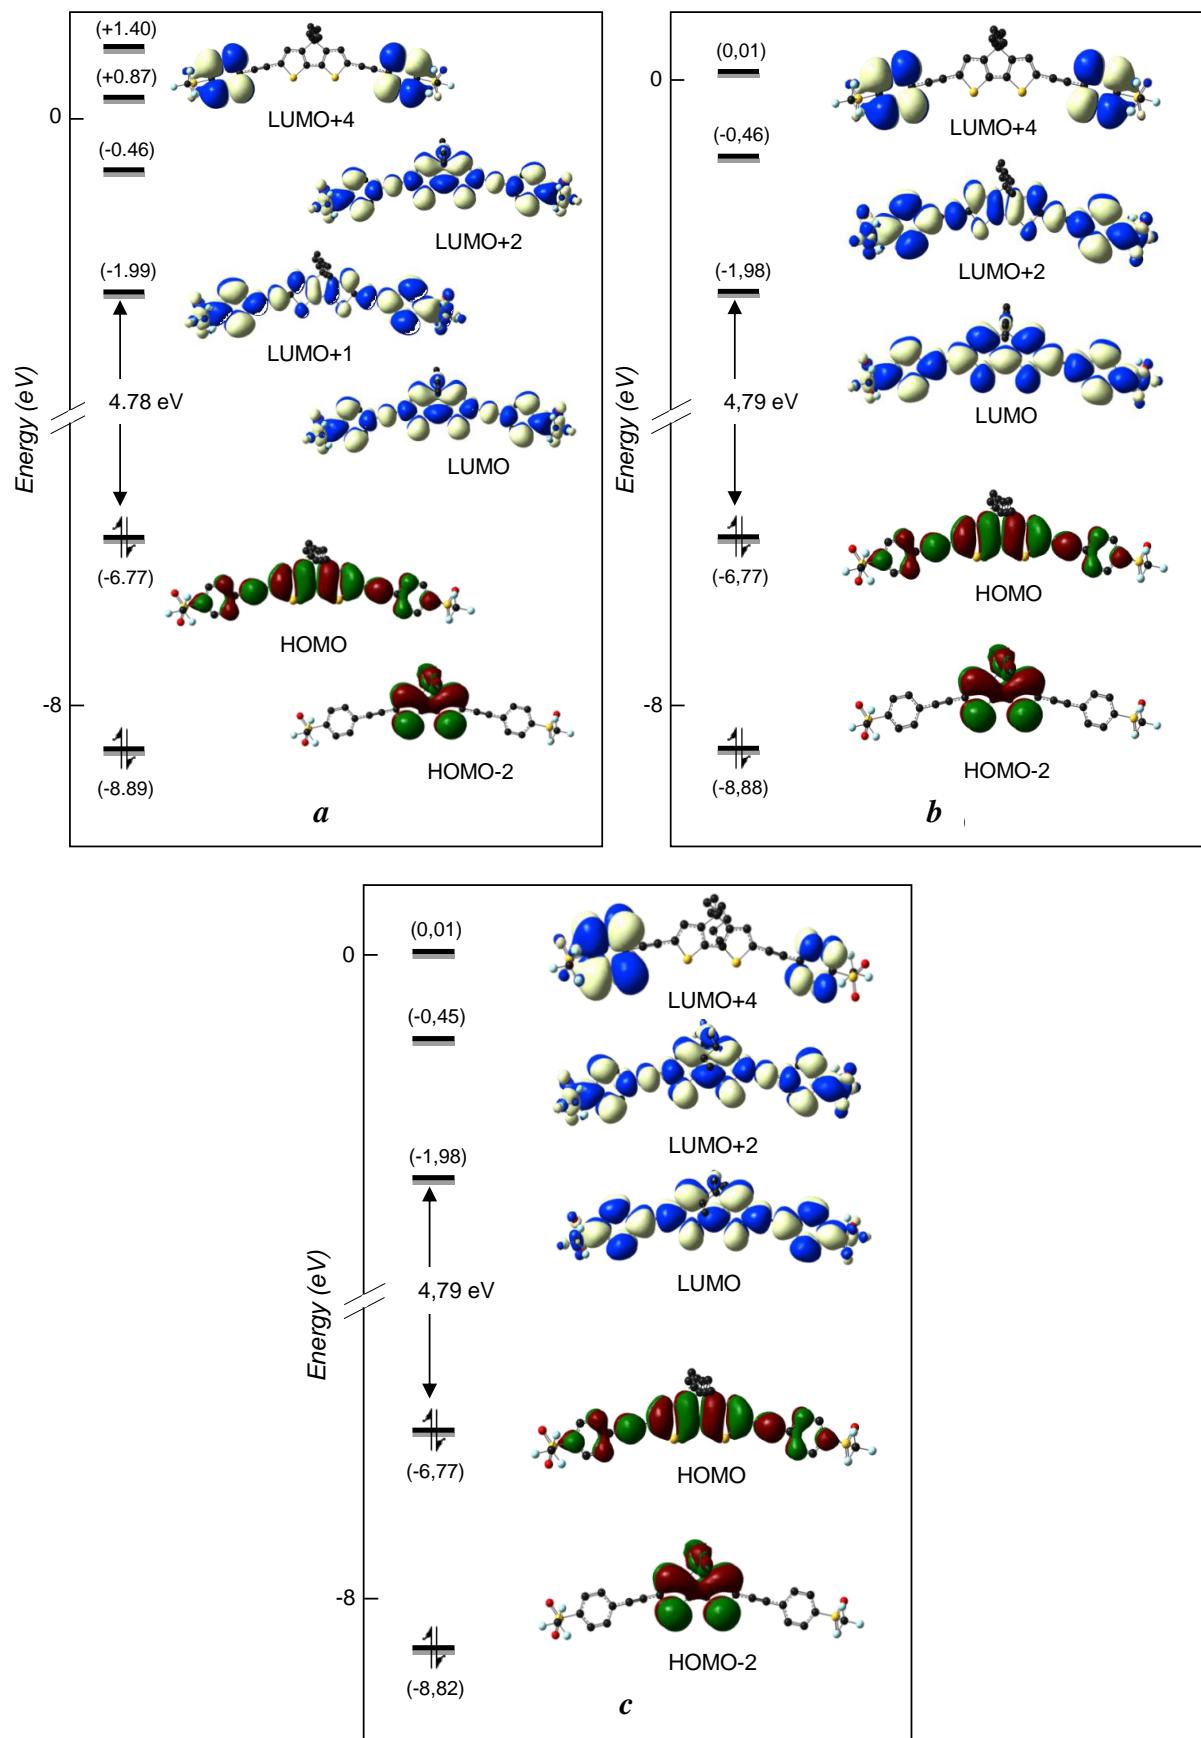

**Table S2.** Pertinent computed bond lengths (Å), bond angles ( $^\circ$ ), and dihedral angles ( $^\circ$ ) for compounds **1a-2b**. See Scheme S1 for the atom numbering.

## 5. Vibronic calculations for emissions of **1a,b** and **2a,b**

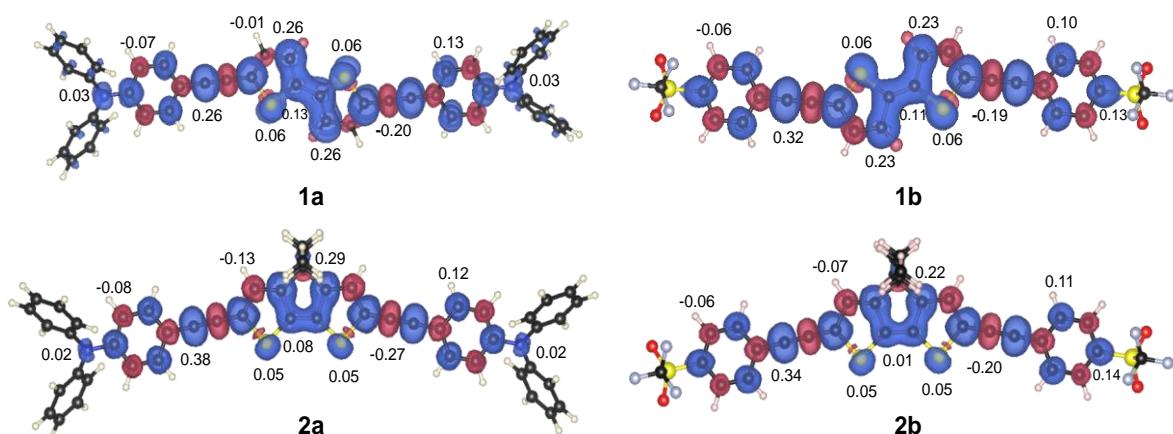

As suggested by the structured emissions observed for all compounds, some vibrational modes appear to contribute to the fluorescence decay more than others. The so-called AH approach was used (*vide infra*) to learn more about these particular modes. Note that in order to reach a sufficient spectrum convergence (>90%), normal modes smaller than 100 cm<sup>-1</sup> were excluded from the vibronic calculations. These are modes that involve deformations of the two thiophene and phenyl rings, appearing at 1466 and 1502 cm<sup>-1</sup> for **2b**, 726 and 1522 cm<sup>-1</sup> for **1b**, 1081 and 1529 cm<sup>-1</sup> for **1a**, and 1464 and 1500 cm<sup>-1</sup> for **2a** in the S<sub>1</sub> excited state (Figure S15). According to our simulations, a normal mode with such characteristics occurs at ca. 1500 cm<sup>-1</sup> with a moderate shift vector. It corresponds to a mixture of C-C stretching and C-H bending localized on the bithiophene and phenyl rings, consistent with structural changes in the lowest excited state being mostly located on the thiophene rings in **1a,b** and **2a,b**, in line with its assignment as a  $\pi \rightarrow \pi^*$  transition.

**Figure S15.** Representation of the normal mode eigenvectors with the largest shift-vectors for **2b**, **1b**, **1a** and **2a** during the S<sub>1</sub>-S<sub>0</sub> transition in toluene, computed at the CAM-B3LYP/6-31+G(d) level in toluene.

## 6. Calculated spin density in the first triplet ( $T_1$ ) excited state of **1a,b** and **2a,b**

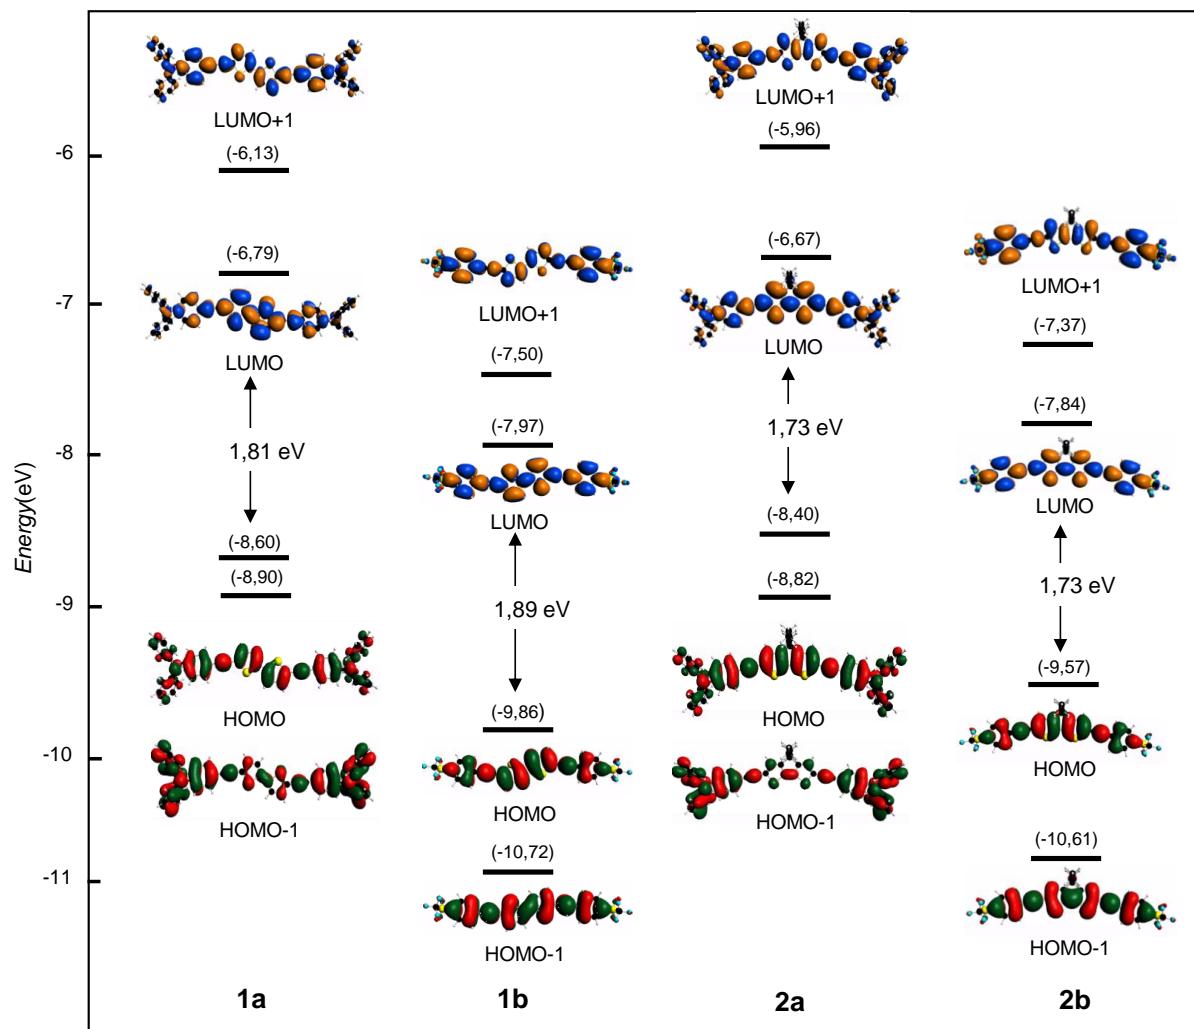

The spin distribution was computed for **1a,b** and **2a,b** to map the localization of unpaired electrons in the  $T_1$  triplet states (Figure S16). For all these molecules, the positive spin density accumulates around the central C=C-S units, adopting a z-shaped distribution in the *trans*-disposed-bithiophene conformers **1a-b** and a u-shaped distribution in **2a,b**, while the negative spin density alternates with positive spin density on the  $\pi$ -manifolds of the peripheral phenylethynyl arms. Interestingly, there is no localization of spin density on the butyl groups, the triflate groups, or the diphenylamino-substituted peripheral phenyls. Calculations indicate that within each family (**1a,b** or **2a,b**), proceeding from the triflate to the diphenylamino-substituted derivative slightly increases the spin density in the  $\pi$ -manifold of the central bithiophene unit and that, for a given terminal substituent, proceeding from a bithiophene-cored to a fused cyclopentadithiophene-cored compound has the same effect. Thus, the maximal spin density in the  $T_1$  state is found for **2b** and decreases in the order: **2b** > **2a** ≈ **1b** > **1a**, while the spin density on the sulfur atom is slightly lower in **2a,b** than in **1a,b** and is independent of the peripheral substituent.

**Figure S16.** 3D map of the spin density, for structures **1a,b** and **2a,b** in their first triplet state computed at the CAM-B3LYP/6-31+G(d) level in toluene. An iso-surface value of  $8 \times 10^{-3}$  electron. $\text{\AA}^{-2}$  was used for this plot. The positive and negative electron spin are represented in blue and pink, respectively. The graphics were created using VESTA software.<sup>1</sup>
