

## **Supplementary information**

### **Contrasting Genetic Footprints among Saharan Olive Populations: Potential Causes and Conservation Implications**

**G. Besnard, et al.**

#### **Supplementary information includes:**

**Table S1.** List of populations characterized in the present study

**Table S2.** Haplotypes revealed at five single-copy genes in nine Laperrine's olive individuals

**Table S3.** Complete dataset, including genetic profile (nuclear SSR profile + chorotype), GPS coordinates, massif, population and subpopulation for each studied tree

**Table S4.** Genetic diversity and microsatellite summary statistics by sampling site

**Table S5.** cpSSR profile and frequency of the 20 haplotypes detected in central Sahara based on 15 polymorphic plastid loci

**Table S6.** Pairwise  $F_{ST}$  values between the 15 Ahaggar subpopulations based on plastid haplotypes and 12 nuclear SSRs

**Figure S1.** Mean allelic richness and gene diversity according to elevation within the Ahaggar massif assessed on chlorotypes and nuclear microsatellites

**Figure S2.** Inference of population structure on the whole dataset (377 diploid genotypes) using model-based Bayesian clustering implemented in STRUCTURE

**Figure S3.** Inference of population structure on 226 individuals with no missing data using model-based Bayesian clustering implemented in STRUCTURE

**Figure S4.** Pairwise kinship relationships according to geographic distance in Laperrine's olives of Central Sahara

**Figure S5.** Pairwise kinship relationships according to geographic distance in Laperrine's olives of the Ahaggar massif

**Figure S6.** Pairwise kinship relationships according to geographic distance in Laperrine's olives of the Tassili n'Ajjer massif

**Figure S7.** Pairwise kinship relationships according to geographic distance in Laperrine's olives of the Tamgak massif

**Figure S8.** Pairwise kinship relationships according to geographic distance in Laperrine's olives of the Bagzane massif

**Figure S9.** Comparison of pairwise kinship relationships (Loiselle et al. 1995) according to geographic distance in four Saharan massifs on a 6-km scale

#### **References**

**Table S1.** List of locations characterized in the present study. The locality of sampling, the number of genotyped individuals (N) and the GPS coordinates of the location are given. See Table S3 for GPS coordinates of each individual. The number of individuals analyzed with nuclear SSRs (nSSR) and plastid SSRs (cpSSR) is given for each location.

Locality, mountain range	Country	N (nSSR)	N (cpSSR)	Lat.	Long.

\* Including one polyploid individual that was excluded in some analyses; <sup>a</sup> Localities of 'Adrar Heggueghene'.

**Table S2.** Haplotypes (alleles) revealed at five single-copy genes in nine Laperrine's olive individuals. Alleles were coded following Besnard and El Bakkali (2004). Eight new haplotypes were detected in subspecies *laperrinei*. These sequences were then coded with L followed by a number and deposited in GenBank (EMBL numbers: LN879505 to LN879512, and OA985244 to OA985245). Three individuals were previously reported to be (auto)triploids (3n; Besnard & Baali-Cherif 2009), and three alleles were recorded at each locus. For these individuals, when two distinct alleles were present, relative intensity of peaks in sequence chromatograms allowed us to define which allele was present in double. When necessary, alleles were also separately sequenced after cloning (methods described in Besnard and El Bakkali 2014).

\* Note that *OEW-L2* and -L2b are variants of *OEW-E2*, being distinguished by the addition of one or two T in a poly-T stretch (homoplasious information not taken into account in the network reconstruction; see Besnard & El Bakkali 2014).

**Table S4.** Genetic diversity and microsatellite summary statistics by sampling site. We give the total number of observed alleles ( $N_a$ ) on the whole sample for each locus. For each sampling site, allelic richness ( $R_s$ ; estimated for 45 diploid genotypes), observed heterozygosity ( $H_o$ ), genetic diversity ( $H_T$ ), effective number of haplotypes ( $N_e$ ) estimated from nuclear SSR data (nDNA) and plastid haplotypes (cpDNA) are given for each locus and on average.

Locus	$N_a$	Ahaggar					Tassili n'Ajjer					Tamgak					Bagzane				
		$N$	$R_s$	$H_o$	$H_T$	$N_e$	$N$	$R_s$	$H_o$	$H_T$	$N_e$	$N$	$R_s$	$H_o$	$H_T$	$N_e$	$N$	$R_s$	$H_o$	$H_T$	$N_e$

**Table S5.** Plastid SSR (cpSSR) profile and frequency of the 20 haplotypes detected in central Sahara based on 15 polymorphic plastid loci (see Table S3b; Besnard et al. 2011). Thirteen loci revealed two alleles, while the two remaining showed three (locus 19) and four alleles (locus 1). Loci 9, 19, and 33 have been already used in Besnard et al. (2007). Freq. = Frequency.

\* significantly different from 0 ( $p < 0.01$ ), based on 105'000 permutations.

**Figure S1.** Mean allelic richness ( $R_S$ ) and gene diversity ( $H_T$ ) according to elevation within the Ahaggar massif assessed on chlorotypes (cpDNA) and nuclear microsatellites (nSSR). Six classes of altitudinal range were defined: (i) 1400 to 1499 m (63 individuals), (ii) 1500 to 1599 m (45 ind.), (iii) 1600 to 1699 m (41 ind.), (iv) 1700 to 1799 m (17 ind.), (v) 1800 to 1899 m (55 ind.), and (vi) > 1900 m (11 ind.). A trend line (with a coefficient of determination) is given on each graph. For nSSRs,  $R_S$  and  $H_T$  were estimated on eight loci with no missing data: DCA01, DCA03, DCA05, DCA08, DCA09, DCA15, DCA18, and GAPU71A.

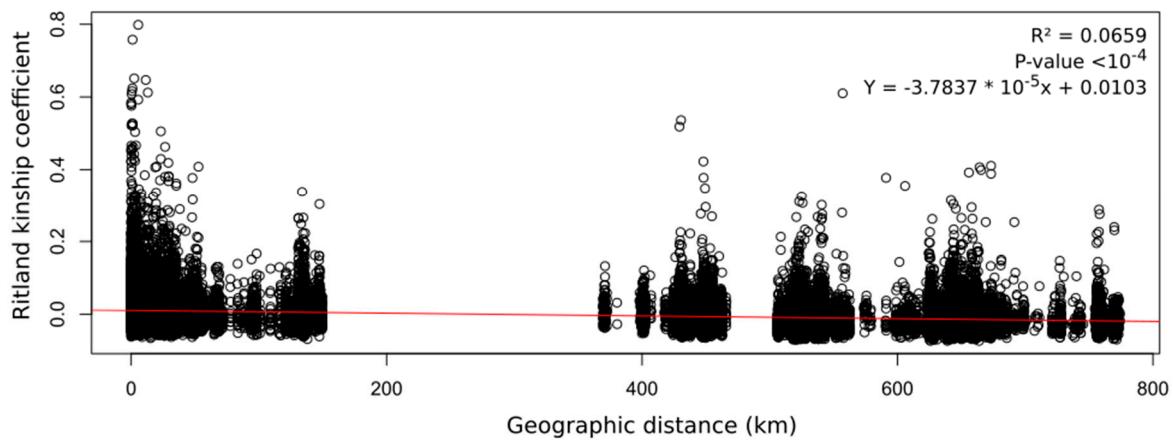

**Figure S2.** Inference of population structure using model-based Bayesian clustering implemented in STRUCTURE (Pritchard et al. 2000). This analysis was performed on the whole dataset (377 diploid genotypes; Table S3) based on 12 nuclear microsatellites (see Fig. S3 for the analysis excluding all individuals with missing data). The membership coefficient of assignment ( $p$ ) of each individual to different gene pools is shown for  $K = 2$ ,  $K = 3$ , and  $K = 4$  clusters.  $H'$  represents the similarity coefficient between ten runs for each  $K$  value, and  $\Delta K$  is the ad-hoc measure of Evanno et al. (2005). The graph at the bottom right gives  $\Delta K$  plotted against  $K$ . The most likely genetic structure model is  $K = 2$ , according to  $\Delta K$  and  $H'$ . At this  $K$  value, most individuals are correctly assigned to Niger or Algeria clusters. At  $K = 3$ , the Algerian cluster is split into two clusters suggesting a low differentiation between Tassili n'Ajjer and Ahaggar. At  $K = 4$ , clustering within the Ahaggar is unclear.

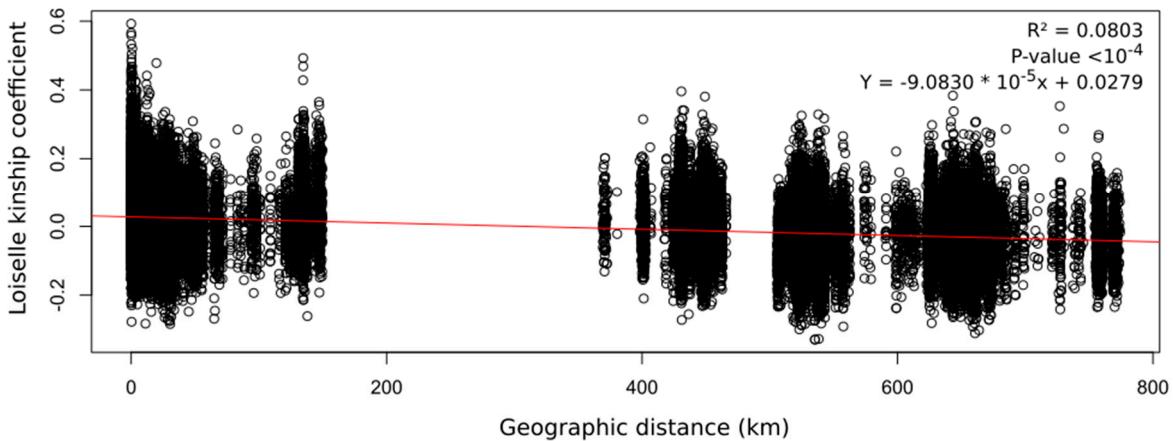

**Figure S3.** Inference of population structure on 226 individuals with no missing data using model-based Bayesian clustering implemented in STRUCTURE (Pritchard et al. 2000). The membership coefficient of assignment ( $p$ ) of each individual to different gene pools is shown for  $K = 2$ ,  $K = 3$ , and  $K = 4$  clusters.  $H'$  represents the similarity coefficient between ten runs for each  $K$  value, and  $\Delta K$  is the ad-hoc measure of Evanno et al. (2005). The graph at the bottom right gives  $\Delta K$  plotted against  $K$ . The four main massifs are indicated as pre-defined regions. The most likely genetic structure model is  $K = 2$ , according to  $\Delta K$  and  $H'$ . At this  $K$  value, most individuals are correctly assigned to Niger (N) or Algeria (A) clusters. At  $K = 3$ , the Algerian cluster is split into two clusters (A1 and A2) suggesting a low differentiation between Tassili n'Ajjer and Ahaggar. Finally, at  $K = 4$ , two gene pools are distinguished in Niger (N1 for Bagzane, and N2 for Tamgak).

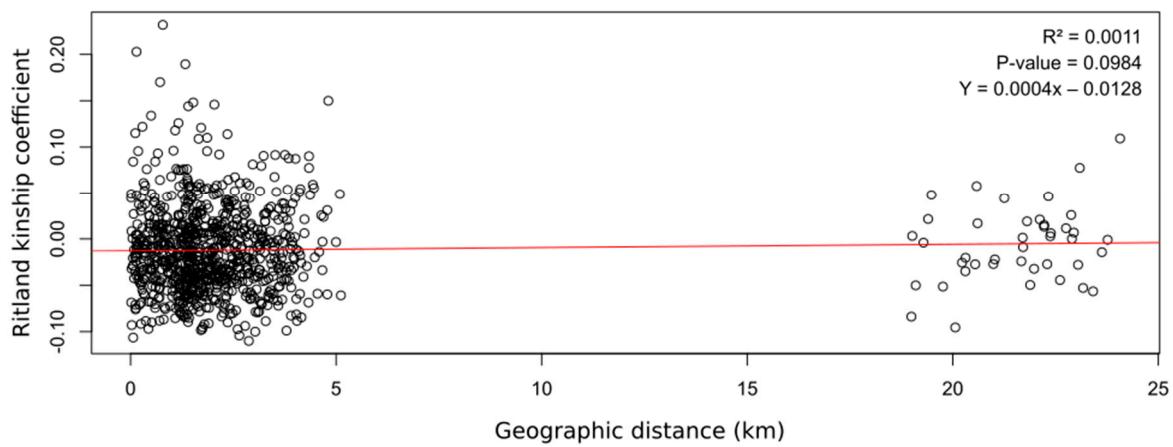

**Figure S4.** Pairwise kinship relationships according to geographic distance in Laperrine's olives of Central Sahara (North Niger and Southeast Algeria). The R-square and *p*-value statistics are given in the upper right. Each point represents a kinship estimate on a pair of individuals: **a)** for the Ritland coefficient (Ritland 1996), and **b)** for the Loiselle coefficient (Loiselle et al. 1995).

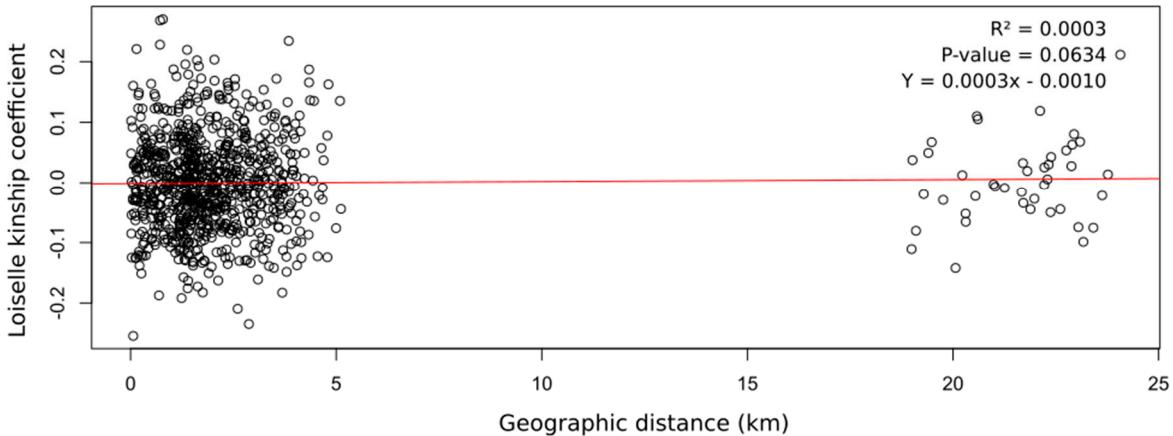

**Figure S5.** Pairwise kinship relationships according to geographic distance in Laperrine's olives of the Ahaggar massif (Southeast Algeria). The R-square and *p*-value statistics are given in the upper right. Each point represents a kinship estimate on a pair of individuals: **a)** for the Ritland coefficient (Ritland 1996), and **b)** for the Loiselle coefficient (Loiselle et al. 1995).
