Supplementary Materials

(a)

(b)

Figure S1. Upper figure: Wet weight variations in thallus clusters of six strains of *Ulva prolifera* incubated in vitro at one of five different temperatures, $150 \mu\text{mol photons m}^{-2} \text{s}^{-1}$ (12/12 h light/dark cycle) in half-strength ES medium with aeration for 8 d. Lower figure: the same data expressed as natural logarithms. The slopes for each combination of strain and temperature were used to generate the relative growth rate values in Figure 2.

Table S1. Differences in RGR, Carbon, and nitrogen contents among five strains of *Ulva prolifera* at 10, 15, 20, 25, and 30 °C. Data were analyzed using Kruskal-Wallis test followed by post-hoc Scheffe's test for multiple comparisons.
