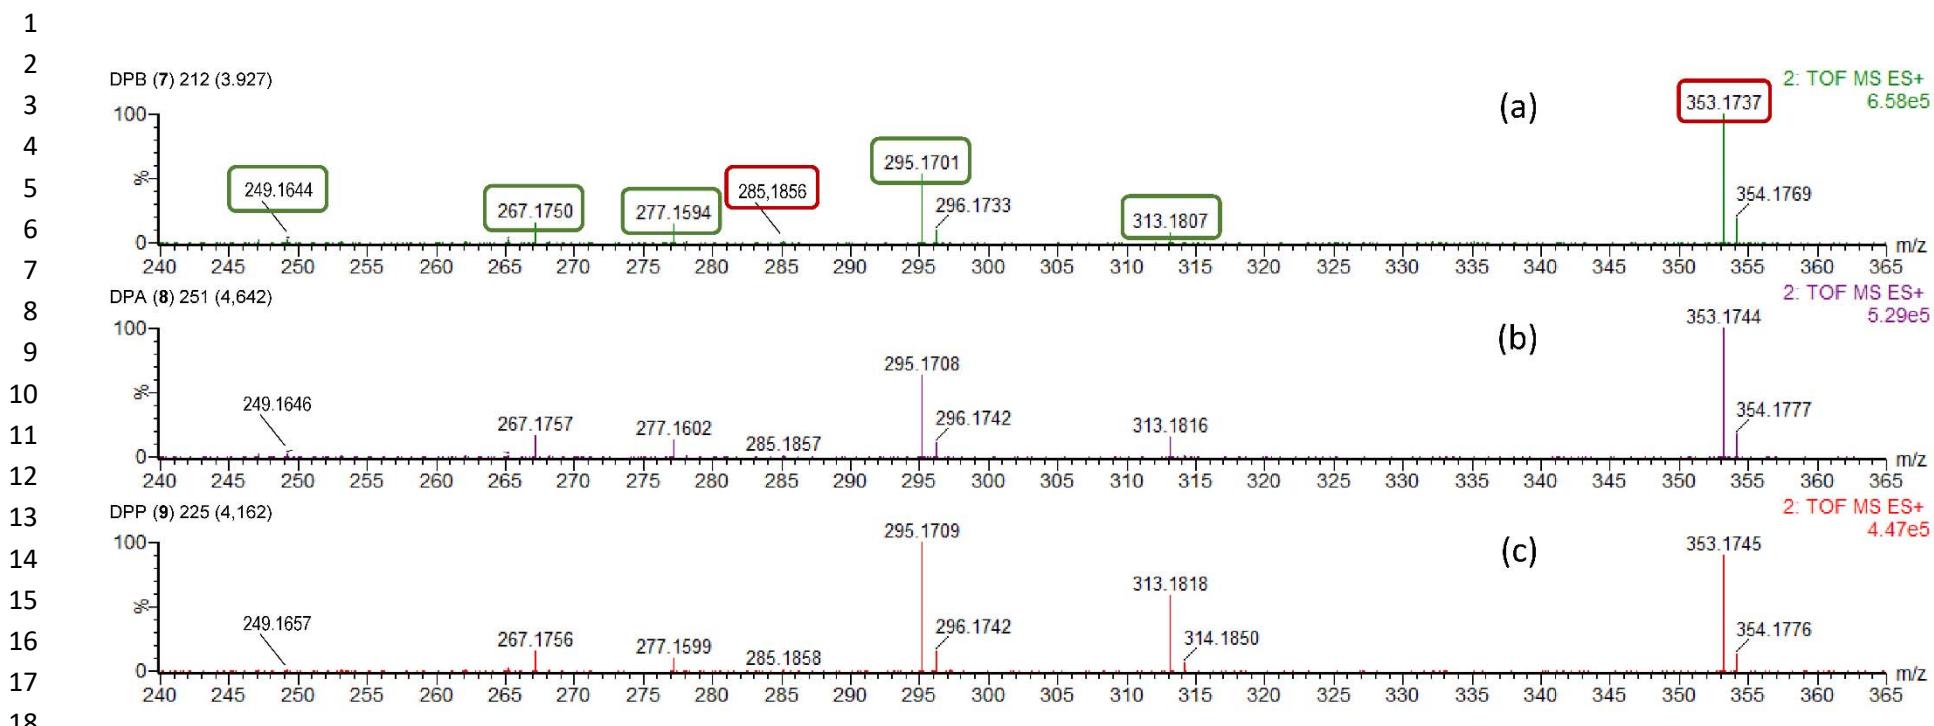

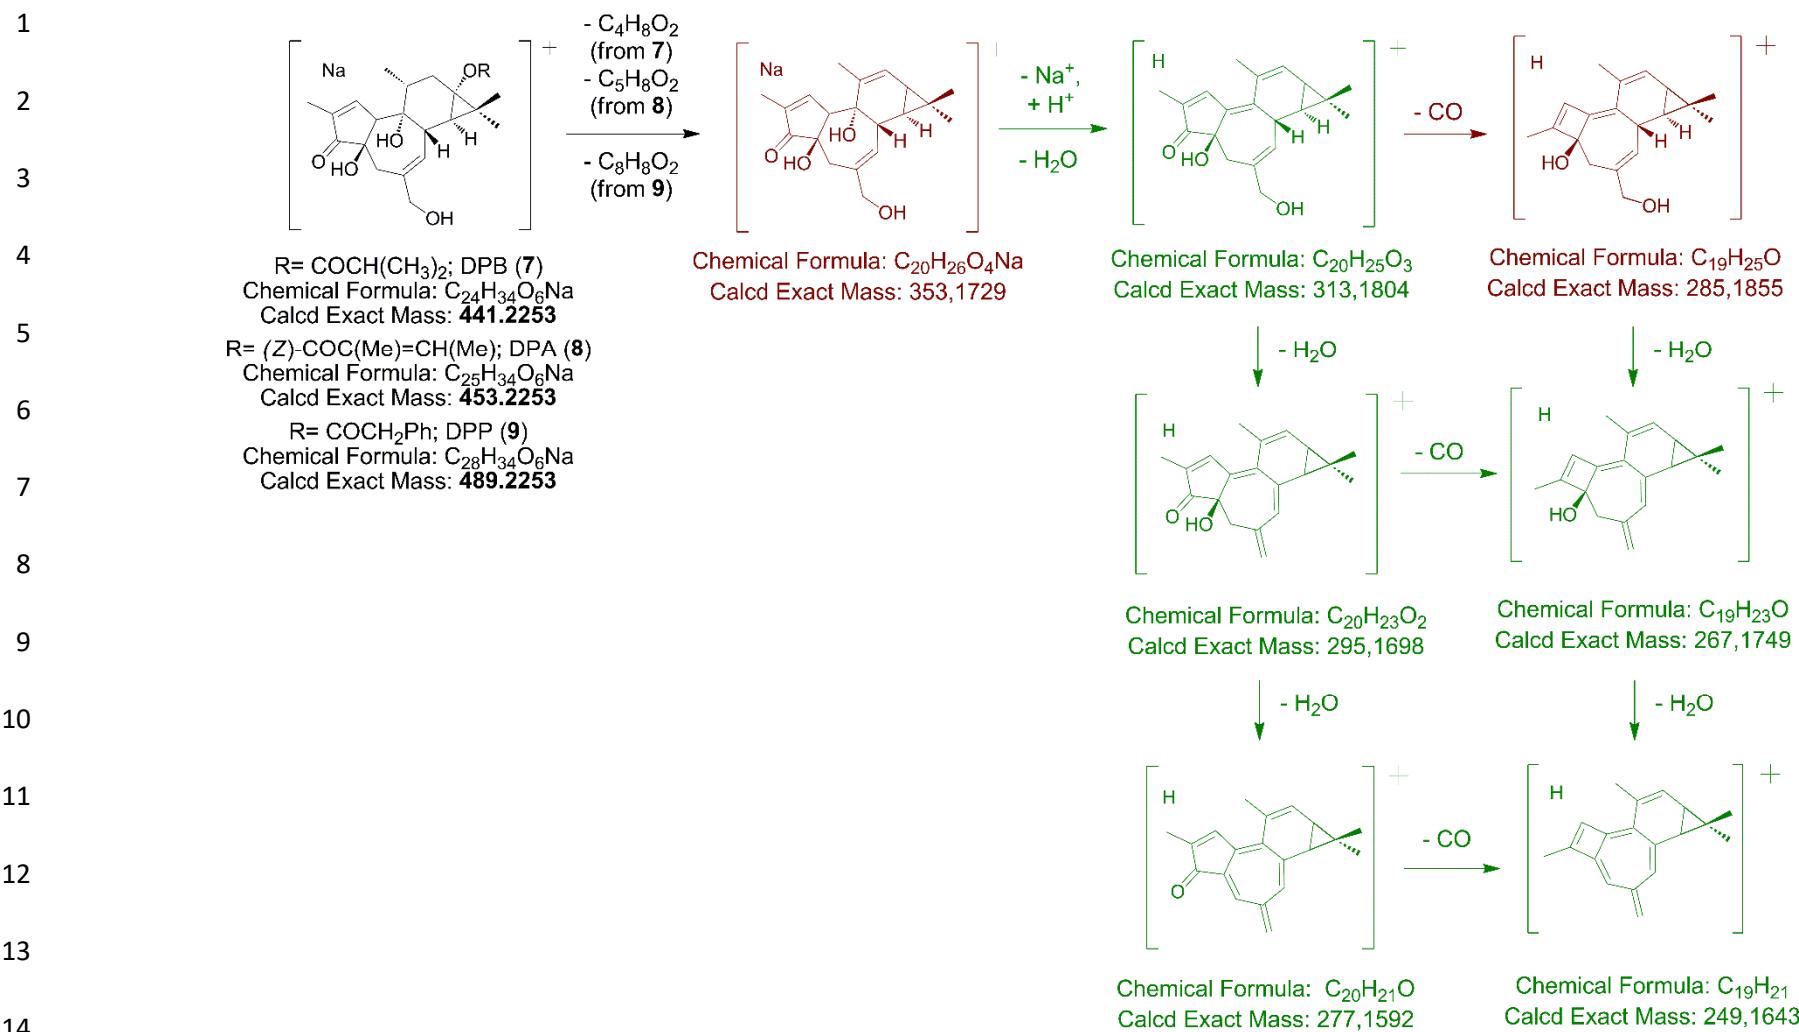

Figure S24. Comparison of HRMS<sup>E</sup> spectra (DIA) [1] for: (a) DPB (7), (b) DPA (8) and, (c) DPP (9) X23; m/z range 240-365 (m/z range 240-540 in Figure S23) (data acquired in positive ionization with a ramp trap collision energy of the high-energy function set at 10-40 eV). Compounds 7, 8 and 9 show daughter ions from their corresponding [M+Na]<sup>+</sup> molecular ions (see Figure S23) in their HRMS<sup>E</sup> spectra at m/z 313.1804, 295.1698, 277.1592, 267.1749 and 249.1643 (calculated) (in green in Scheme 3, Figures S24a and S25) which could be assigned to losses of water (1, 2 and 3 molecules), 2 molecules of water and CO and 3 molecules of water and CO, respectively, from a precursor ion at m/z 353.1729 (calculated) (in red in Scheme 3, Figures S24a and S25) (Table S2). Last mentioned ion, which is relatively abundant in HRMS<sup>E</sup> spectra of DPB (7) DPA (8) and DPP (9) (Table S2, Figures S23 and S24) originates from a loss of an ester group at C-13 from parent molecular ions in each compound (Figure S23). See proposed fragmentation route for selected ions mentioned above in Scheme 3 and Figure S25, together with colour key
