SUPPLEMENTARY MATERIALS

S.1. Membrane Equations and Its Solution

An initially flat, peripherally fixed, linearly elastic circular membrane with Poisson's ratio ν , Young's modulus of elasticity E , thickness h , and radius a is subjected to a pressure q . When the pressure q reaches a large enough value, the deflected circular membrane will come in contact with a frictionless rigid flat plate being parallel to the initially flat circular membrane, as shown in Figure S1, where r is the radial coordinate, w is the transversal displacement, d is the contact radius between the deflected circular membrane contacting and the frictionless rigid plate, and g is the parallel gap between the frictionless rigid plate and the initially flat circular membrane. Such a contact problem can be viewed as consisting of two local membrane problems in the central portion of $0 \leq r \leq d$ and in the annular portion of $d \leq r \leq a$, which are connected by the continuity conditions at $r=d$. The problem in $0 \leq r \leq d$ may be simplified as a plane stretching problem, while the problem in $d \leq r \leq a$ is the large deflection problem of an annular membrane under the pressure q . In the annular portion of $d \leq r \leq a$, let us take a piece of the circular membrane with radius r ($d \leq r \leq a$) from the central portion of the deflected whole circular membrane (that is, this piece of the circular membrane includes the deflected circular membrane in the contact region $0 \leq r \leq d$), to study the static problem of equilibrium of this piece of the circular membrane, as shown in Figure S2, where σ_r is the radial stress, and θ is the rotation angle of the deflected circular membrane.

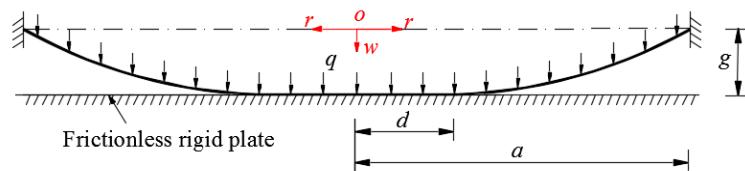

Figure S1. Sketch of a deflected circular membrane in contact with a frictionless rigid plate.

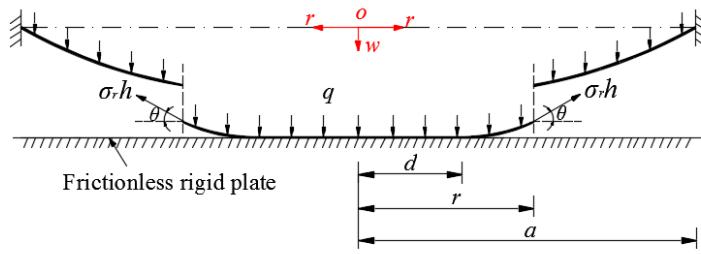

Figure S2. Sketch of the static equilibrium of the deflected circular membrane with radius $d \leq r \leq a$.

In the vertical direction perpendicular to the initially flat circular membrane (see Figure S2), there are three vertical forces, the vertical force $2\pi r \sigma_r h \sin \theta$ produced by the membrane force $\sigma_r h$, the total reaction force $\pi d^2 q$ from the frictionless rigid plate, and the total action force $\pi r^2 q$ of the pressure q within radius r , where $d \leq r \leq a$. So, the equilibrium condition in the vertical direction is

$$2\pi r \sigma_r h \sin \theta + \pi d^2 q = \pi r^2 q, \quad (\text{S1})$$

where

$$\sin \theta = 1 / \sqrt{1 + 1 / \tan^2 \theta} = 1 / \sqrt{1 + 1 / (-dw / dr)^2}. \quad (\text{S2})$$

Substituting Equation (S2) into Equation (S1) one has

$$2r\sigma_r h = (r^2 - d^2)q\sqrt{1 + 1 / (dw / dr)^2}. \quad (\text{S3})$$

If the circumferential stress is denoted by σ_t , then the equilibrium condition in the horizontal direction parallel to the initially flat circular membrane may be written as [5]

$$\frac{d}{dr}(r\sigma_r h) - \sigma_t h = 0. \quad (\text{S4})$$

If the radial and circumferential strain, and the radial displacement are respectively expressed as e_r , e_t and u , then the geometric equations for large deflection problems may be written as [6]

$$e_r = [(1 + \frac{du}{dr})^2 + (\frac{dw}{dr})^2]^{1/2} - 1 \quad (\text{S5})$$

and

$$e_t = \frac{u}{r}. \quad (\text{S6})$$

Moreover, the relationships between stress and strain, the physical equations, still satisfy the generalized Hooke's law and are given by [3]

$$\sigma_r = \frac{E}{1-\nu^2}(e_r + \nu e_t) \quad (\text{S7})$$

and

$$\sigma_t = \frac{E}{1-\nu^2}(e_t + \nu e_r). \quad (\text{S8})$$

Substituting Equations (S5) and (S6) into Equations (S7) and (S8) yields

$$\sigma_r = \frac{E}{1-\nu^2}\{[(1 + \frac{du}{dr})^2 + (\frac{dw}{dr})^2]^{1/2} - 1 + \nu \frac{u}{r}\} \quad (\text{S9})$$

and

$$\sigma_t = \frac{E}{1-\nu^2} \left\{ \frac{u}{r} + \nu [(1 + \frac{du}{dr})^2 + (\frac{dw}{dr})^2]^{1/2} - \nu \right\}. \quad (S10)$$

By means of Equations (S4), (S9) and (S10), one has

$$\frac{u}{r} = \frac{1}{E} (\sigma_t - \nu \sigma_r) = \frac{1}{E} \left[\frac{d}{dr} (r \sigma_r) - \nu \sigma_r \right]. \quad (S11)$$

Substituting the u of Equation (S11) into Equation (S9) yields

$$[\frac{1}{E} \sigma_r - \frac{\nu}{E} \frac{d}{dr} (r \sigma_r) + 1]^2 - \left\{ \frac{1}{E} \frac{d}{dr} [r \frac{d}{dr} (r \sigma_r)] - \frac{\nu}{E} \frac{d}{dr} (r \sigma_r) + 1 \right\}^2 - (\frac{dw}{dr})^2 = 0. \quad (S12)$$

In the plate/membrane contact region of the central portion ($0 \leq r \leq d$), the strain and stress are always uniformly distributed [5], that is,

$$e_r = e_t = \frac{u(d)}{d} \quad (S13)$$

and

$$\sigma_r = \sigma_t = \frac{E}{1-\nu} \frac{u(d)}{d}. \quad (S14)$$

So, the boundary conditions at $r=a$ and the continuous conditions at $r=d$ are

$$w=0 \quad \text{at } r=a, \quad (S15)$$

$$u=0 \quad \text{at } r=a \quad (S16)$$

and

$$w=g \quad \text{at } r=d, \quad (S17)$$

$$\left(\frac{u}{r} \right)_A = \left(\frac{u}{r} \right)_B = \frac{u(d)}{d} \quad \text{at } r=d, \quad (S18)$$

$$(\sigma_r)_A = (\sigma_r)_B = \frac{E}{1-\nu} \frac{u(d)}{d} \quad \text{at } r=d, \quad (S19)$$

where the subscripts A and B denote the two sides of the inter-connecting circle of $r=d$, A refers the side to plate/membrane contact, and B refers the side to plate/membrane non-contact.

Introduce the following dimensionless variables

$$Q = \frac{qa}{Eh}, \quad W = \frac{w}{a}, \quad S_r = \frac{\sigma_r}{E}, \quad S_t = \frac{\sigma_t}{E}, \quad x = \frac{r}{a}, \quad \alpha = \frac{d}{a}, \quad (S20)$$

and transform Equations (S3), (S12), (S4), (S15), (S16), (S17), (S18) and (S19) into

$$[4x^2 S_r^2 - Q^2(x^2 - \alpha^2)^2] \left(\frac{dW}{dx} \right)^2 - Q^2(x^2 - \alpha^2)^2 = 0, \quad (S21)$$

$$[S_r - \nu \frac{d}{dx} (x S_r) + 1]^2 - \left\{ \frac{d}{dx} [x \frac{d}{dx} (x S_r)] - \nu \frac{d}{dx} (x S_r) + 1 \right\}^2 - \left(\frac{dW}{dx} \right)^2 = 0, \quad (S22)$$

$$S_t = S_r + x \frac{dS_r}{dx}, \quad (S23)$$

$$W = 0 \text{ at } x = 1, \quad (S24)$$

$$S_t - \nu S_r = 0 \text{ at } x = 1 \quad (S25)$$

and

$$W = \frac{g}{a} \text{ at } x = \alpha, \quad (S26)$$

$$(S_t - \nu S_r)_A = (S_t - \nu S_r)_B = \frac{u(b)}{b} \text{ at } x = \alpha, \quad (S27)$$

$$(S_r)_A = (S_r)_B = \frac{1}{1-\nu} \frac{u(b)}{b} \text{ at } x = \alpha. \quad (S28)$$

Expanding S_r and W into the power series of $x - (1+\alpha)/2$, i.e., letting

$$S_r = \sum_{i=0}^{\infty} b_i (x - \frac{1+\alpha}{2})^i, \quad (S29)$$

$$W = \sum_{i=0}^{\infty} c_i (x - \frac{1+\alpha}{2})^i. \quad (S30)$$

Substituting Equations (S29) and (S30) into Equations (S21) and (S22), the power series coefficients c_i ($i=2,3,4,\dots$) and d_i ($i=1,2,3,4,\dots$) can be expressed by the polynomial of b_0 , b_1 and α , which are listed in this Supplementary Materials S.2. The coefficient c_0 is another unknown constant.

The remaining three coefficients b_0 , b_1 and c_0 and the dimensionless variable α ($\alpha = d/a$) are usually known as undetermined constants, and can be determined by using the boundary conditions and continuous conditions as follows. From Equation (S30), Equations (S24) and (S26) give

$$\sum_{i=0}^{\infty} c_i (\frac{1-\alpha}{2})^i = 0 \quad (S31)$$

and

$$\sum_{i=0}^{\infty} c_i (\frac{\alpha-1}{2})^i = \frac{g}{a}. \quad (S32)$$

Equation (S32) minus Equation (S31) yields

$$\sum_{i=1}^{\infty} c_i [(\frac{\alpha-1}{2})^i - (\frac{1-\alpha}{2})^i] = \frac{g}{a}. \quad (S33)$$

From Equations (S23) and (S29), Equations (S25), (S27) and (S28) yield

$$(1-\nu) \sum_{i=0}^{\infty} b_i (\frac{1-\alpha}{2})^i + \sum_{i=1}^{\infty} i b_i (\frac{1-\alpha}{2})^{i-1} = 0, \quad (S34)$$

$$(1-\nu) \sum_{i=0}^{\infty} b_i (\frac{\alpha-1}{2})^i + \alpha \sum_{i=1}^{\infty} i b_i (\frac{\alpha-1}{2})^{i-1} = \frac{u(d)}{d} \quad (S35)$$

and

$$\sum_{i=0}^{\infty} b_i \left(\frac{\alpha-1}{2}\right)^i = \frac{1}{1-\nu} \frac{u(d)}{d}. \quad (\text{S36})$$

Eliminating the $u(d)/d$ from Equations (S35) and (S36), one has

$$\alpha \sum_{i=1}^{\infty} i b_i \left(\frac{\alpha-1}{2}\right)^{i-1} = 0. \quad (\text{S37})$$

For the given problem where a, h, E, ν, g and q are known in advance, the undetermined constants b_0, b_1 and α can be determined by the simultaneous solutions of Equations (S33), (S34) and (S37). Furthermore, substituting the known b_0, b_1 and α into Equation (S31) or Equation (S32), the last undetermined constant c_0 can also be determined. The problem dealt with here is thus solved.

S.2. Recursive Relations for Power Series Coefficients

$$\begin{aligned} b_2 &= \frac{1}{2\beta^2} (\beta\nu b_1 - 3\beta b_1 + \nu b_0 - b_0 - 1 + (\beta^2 \nu^2 b_1^2 + 2\beta\nu^2 b_0 b_1 - 2\beta\nu b_0 b_1 + \nu^2 b_0^2 - 2\beta\nu b_1 \\ &\quad - 2\nu b_0^2 - 2\nu b_0 + b_0^2 - c_1^2 + 2b_0 + 1)^{1/2}) \\ b_3 &= -\frac{1}{6\beta^2(2\beta^2 b_2 - \beta\nu b_1 + 3\beta b_1 - \nu b_0 + b_0 + 1)} (20\beta^3 b_2^2 - 4\beta^3 \nu b_2^2 - 20\beta^2 \nu b_1 b_2 \\ &\quad + 38\beta^2 b_1 b_2 - 10\beta\nu b_0 b_2 - 9\beta\nu b_1^2 + 10\beta b_0 b_2 + 12\beta b_1^2 - 3\nu b_0 b_1 + 10\beta b_2 + 3b_0 b_1 \\ &\quad + 2c_1 c_2 + 3b_1) \\ b_4 &= -\frac{1}{24\beta^2(2\beta^2 b_2 - \beta\nu b_1 + 3\beta b_1 - \nu b_0 + b_0 + 1)} (36\beta^4 b_3^2 - 36\beta^3 \nu b_2 b_3 + 204\beta^3 b_2 b_3 \\ &\quad - 84\beta^2 \nu b_1 b_3 - 52\beta^2 \nu b_2^2 + 174\beta^2 b_1 b_3 + 136\beta^2 b_2^2 - 42\beta\nu b_0 b_3 - 86\beta\nu b_1 b_2 + 42\beta b_0 b_3 \\ &\quad + 134\beta b_1 b_2 - 16\nu b_0 b_2 - 12\nu b_1^2 + 42\beta b_3 + 16b_0 b_2 + 15b_1^2 + 6c_1 c_3 + 4c_2^2 + 16b_2) \\ b_5 &= -\frac{1}{20\beta^2(2\beta^2 b_2 - \beta\nu b_1 + 3\beta b_1 - \nu b_0 + b_0 + 1)} (72\beta^4 b_3 b_4 - 32\beta^3 \nu b_2 b_4 - 18\beta^3 \nu b_3^2 \\ &\quad + 192\beta^3 b_2 b_4 + 126\beta^3 b_3^2 - 72\beta^2 \nu b_1 b_4 - 98\beta^2 \nu b_2 b_3 + 156\beta^2 b_1 b_4 + 296\beta^2 b_2 b_3 \\ &\quad - 36\beta\nu b_0 b_4 - 78\beta\nu b_1 b_3 - 46\beta\nu b_2^2 + 36\beta b_0 b_4 + 132\beta b_1 b_3 + 90\beta b_2^2 - 15\nu b_0 b_3 \\ &\quad - 25\nu b_1 b_2 + 36\beta b_4 + 15b_0 b_3 + 35b_1 b_2 + 4c_1 c_4 + 6c_2 c_3 + 15b_3) \\ b_6 &= -\frac{1}{60\beta^2(2\beta^2 b_2 - \beta\nu b_1 + 3\beta b_1 - \nu b_0 + b_0 + 1)} (240\beta^4 b_3 b_5 + 144\beta^4 b_4^2 - 100\beta^3 \nu b_2 b_5 \\ &\quad - 120\beta^3 \nu b_3 b_4 + 620\beta^3 b_2 b_5 + 936\beta^3 b_3 b_4 - 220\beta^2 \nu b_1 b_5 - 316\beta^2 \nu b_2 b_4 - 174\beta^2 \nu b_3^2 \\ &\quad + 490\beta^2 b_1 b_5 + 1036\beta^2 b_2 b_4 + 633\beta^2 b_3^2 - 110\beta\nu b_0 b_5 - 246\beta\nu b_1 b_4 - 314\beta\nu b_2 b_3 \\ &\quad + 110\beta b_0 b_5 + 438\beta b_1 b_4 + 698\beta b_2 b_3 - 48\nu b_0 b_4 - 84\nu b_1 b_3 - 48\nu b_2^2 + 110\beta b_5 + 48b_0 b_4 \\ &\quad + 126b_1 b_3 + 80b_2^2 + 10c_1 c_5 + 16c_2 c_4 + 9c_3^2 + 48b_4) \\ b_7 &= -\frac{1}{42\beta^2(2\beta^2 b_2 - \beta\nu b_1 + 3\beta b_1 - \nu b_0 + b_0 + 1)} (180\beta^4 b_3 b_6 + 240\beta^4 b_4 b_5 - 72\beta^3 \nu b_2 b_6 \\ &\quad - 90\beta^3 \nu b_3 b_5 - 48\beta^3 \nu b_4^2 + 456\beta^3 b_2 b_6 + 750\beta^3 b_3 b_5 + 432\beta^3 b_4^2 - 156\beta^2 \nu b_1 b_6 - 78\beta\nu b_0 b_6 \\ &\quad - 232\beta^2 \nu b_2 b_5 - 270\beta^2 \nu b_3 b_4 + 354\beta^2 b_1 b_6 + 802\beta^2 b_2 b_5 + 1098\beta^2 b_3 b_4 + 12c_3 c_4 - 35\nu b_0 b_5 \\ &\quad - 178\beta\nu b_1 b_5 - 238\beta\nu b_2 b_4 - 129\beta\nu b_3^2 + 78\beta b_0 b_6 + 328\beta b_1 b_5 + 574\beta b_2 b_4 + 336\beta b_3^2 \\ &\quad - 63\nu b_1 b_4 - 77\nu b_2 b_3 + 78\beta b_6 + 35b_0 b_5 + 99b_1 b_4 + 143b_2 b_3 + 6c_1 c_6 + 10c_2 c_5 + 35b_5) \end{aligned}$$

where $\beta = (1 + \alpha) / 2$ and $\eta = (1 + 2\alpha - 3\alpha^2) / 4$.

S.3. An Example of Design and Numerical Calibration Based on Analytical Solutions

Assumed that a capacitive pressure sensor uses a circular conductive membrane with radius $a = 100$ mm, thickness $h = 1$ mm, Young's modulus of elasticity $E = 7.84$ MPa, Poisson's ratio $\nu = 0.47$, and yield strength $\sigma_y = 2.4$ MPa. The insulator layer is assumed to take 0.1 mm of polystyrene, then $t = 0.1$ mm and $\varepsilon_{r1} = 2.7$. In addition, the vacuum permittivity $\varepsilon_0 = 8.854 \times 10^{-3}$ pF/mm, and the air relative permittivity $\varepsilon_{r2} = 1.00053$. The initial air parallel gap g takes 10 mm, 20 mm, 30 mm, 37 mm, respectively.

The total capacitance C of the capacitive pressure sensor under different pressure is determined by Equation (1) before the circular conductive membrane touches the insulator layer, and by Equation (7) after the circular conductive membrane touches the insulator layer. The power series expression for the deflection $w(r)$ in Equation (1) is determined by using the analytical solution given in reference [47], and that for the deflection $w(r)$ in Equation (7) is determined by using the analytical solution given in this Supplementary Materials S.1. The calculation results are listed in Tables S1 and S2 when $g = 10$ mm, in Tables S3 and S4 when $g = 20$ mm, in Tables S5 and S6 when $g = 30$ mm, and in Tables S7 and S8 when $g = 37$ mm.

Table S1. The calculation results of a circular capacitive pressure sensor operating in non-touch mode, where $a = 100$ mm, $h = 1$ mm, $t = 0.1$ mm, $E = 7.84$ MPa, $\nu = 0.47$, and $g = 10$ mm.

S.4. Effect of Membrane Thickness on Capacitance–Pressure Relationships

In this section, the thickness of the circular conductive membrane is first increased from the reference thickness $h = 1$ mm to $h = 1.5$ mm, and then further to $h = 2$ mm. The initial air parallel gap g still takes 10 mm, 20 mm, 30 mm and 37 mm. The calculation results are listed in Tables S9–S16 when $h = 1.5$ mm, and in Tables S17–S24 when $h = 2$ mm. Figure S3 shows the input capacitance–output pressure relationships for $g = 10$ mm and $h = 1$ mm, 1.5 mm and 2 mm, Figure S4 for $g = 20$ mm and $h = 1$ mm, 1.5 mm and 2 mm, Figure S5 for $g = 30$ mm and $h = 1$ mm, 1.5 mm and 2 mm, and Figure S6 for $g = 37$ mm and $h = 1$ mm, 1.5 mm and 2 mm.

From Figures S3–S6 it can clearly be seen that increasing the thickness of the circular conductive membrane can increase the range of the output pressure q , but the range of the input capacitance C is almost unchanged. Therefore, increasing the thickness of the circular conductive membrane can also increase the output pressure per unit capacitance to some extent, because the range of the output pressure q increases while the range of the input capacitance C remains constant. For instance, as the thickness h increases from 1 mm to 1.5 mm and then to 2 mm, the output pressure per unit capacitance for $g = 10$ mm increases from 0.029 KPa/pF to 0.044 KPa/pF and then to 0.058 KPa/pF, that for $g = 20$ mm increases from 0.015 KPa/pF to 0.023 KPa/pF and then to 0.030 KPa/pF, that for $g = 30$ mm increases from 0.019 KPa/pF to 0.028 KPa/pF and then to 0.038 KPa/pF, and that for $g = 37$ mm increases from 0.050 KPa/pF to 0.075 KPa/pF and then to 0.10 KPa/pF, which are calculated from Tables S1–S24.

Table S9. The calculation results of a circular capacitive pressure sensor operating in non-touch mode, where $a = 100$ mm, $h = 1.5$ mm, $t = 0.1$ mm, $E = 7.84$ MPa, $\nu = 0.47$, and $g = 10$ mm.

The capacitance-pressure relationships of a circular capacitive pressure sensor from non-touch mode of operation to touch mode of operation, where $a = 100 \text{ mm}$, $h = 1 \text{ mm}$, 1.5 mm and 2 mm , $t = 0.1 \text{ mm}$, $E = 7.84 \text{ MPa}$, $\nu = 0.47$, and $g = 20 \text{ mm}$.

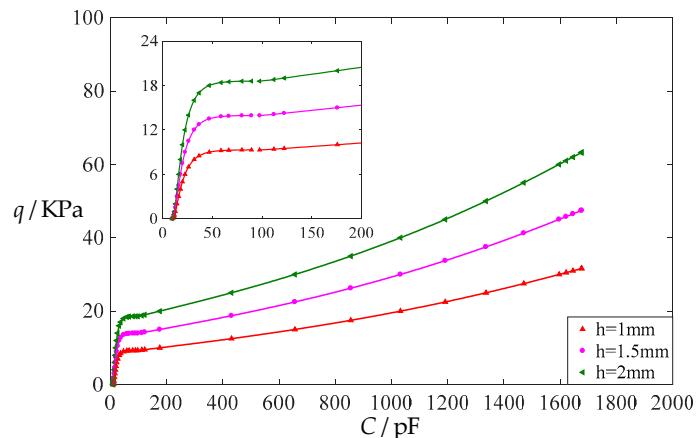

Figure S5. The capacitance-pressure relationships of a circular capacitive pressure sensor from non-touch mode of operation to touch mode of operation, where $a = 100 \text{ mm}$, $h = 1 \text{ mm}$, 1.5 mm and 2 mm , $t = 0.1 \text{ mm}$, $E = 7.84 \text{ MPa}$, $\nu = 0.47$, and $g = 30 \text{ mm}$.

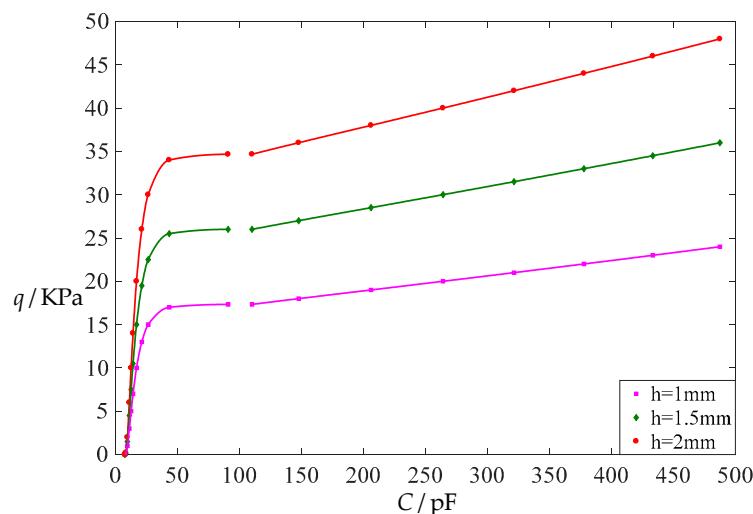

Figure S6. The capacitance-pressure relationships of a circular capacitive pressure sensor from non-touch mode of operation to touch mode of operation, where $a = 100 \text{ mm}$, $h = 1 \text{ mm}$, 1.5 mm and 2 mm , $t = 0.1 \text{ mm}$, $E = 7.84 \text{ MPa}$, $\nu = 0.47$, and $g = 37 \text{ mm}$.

S.5. Effect of Young's Modulus of Elasticity on Capacitance–Pressure Relationships

In this section, the Young's modulus of elasticity E of the circular conductive membrane is first decreased from the reference value $E = 7.84$ MPa to $E = 5$ MPa, and then further to $E = 2.5$ MPa. The initial air parallel gap g still takes 10 mm, 20 mm, 30 mm and 37 mm. The calculation results are listed in Tables S25–S32 when $E = 5$ MPa, and in Tables S33–S40 when $E = 2.5$ MPa. Figure S7 shows the input capacitance–output pressure relationships for $g = 10$ mm and $E = 7.84$ MPa, 5 MPa and 2.5 MPa, Figure S8 for $g = 20$ mm and $E = 7.84$ MPa, 5 MPa and 2.5 MPa, Figure S9 for $g = 30$ mm and $E = 7.84$ MPa, 5 MPa and 2.5 MPa, and Figure S10 for $g = 37$ mm and $E = 7.84$ MPa, 5 MPa and 2.5 MPa.

From Figures S7–S10 it can clearly be seen that decreasing the Young's modulus of elasticity E of the circular conductive membrane can increase both the range of the output pressure q and the range of the input capacitance C . Therefore, the effect of decreasing the Young's modulus of elasticity E on the output pressure per unit capacitance is uncertain. For instance, as the Young's modulus of elasticity E decreases from 7.84 MPa to 5 MPa and then to 2.5 MPa, the output pressure per unit capacitance for $g = 10$ mm increases from 0.029 KPa/pF to 0.041 KPa/pF and then to 0.082 KPa/pF, that for $g = 20$ mm increases from 0.015 KPa/pF to 0.018 KPa/pF and then to 0.030 KPa/pF, that for $g = 30$ mm first decreases from 0.019 KPa/pF to 0.016 KPa/pF and then increases to 0.019 KPa/pF, and that for $g = 37$ mm decreases from 0.050 KPa/pF to 0.021 KPa/pF and then to 0.16 KPa/pF, which are calculated from Tables S1–S8 and S25–S40.

Table S25. The calculation results of a circular capacitive pressure sensor operating in non-touch mode, where $a = 100$ mm, $h = 1$ mm, $t = 0.1$ mm, $E = 5$ MPa, $\nu = 0.47$, and $g = 10$ mm.

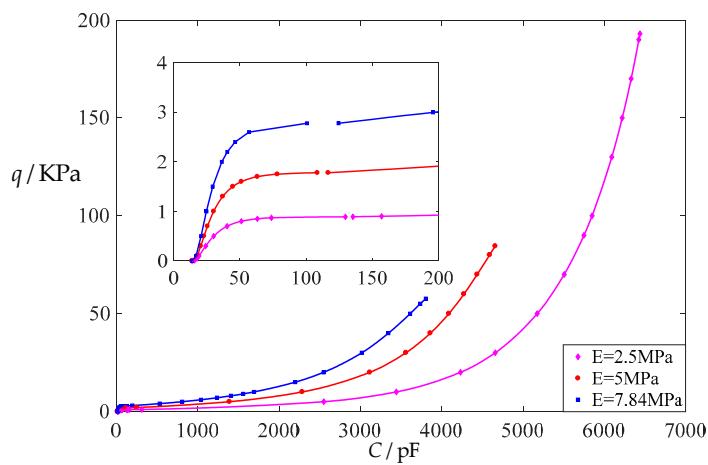

Figure S8. The capacitance-pressure relationships of a circular capacitive pressure sensor from non-touch mode of operation to touch mode of operation, where $a = 100$ mm, $h = 1$ mm, $t = 0.1$ mm, $E = 7.84$ MPa, 5 MPa and 2.5 MPa, $\nu = 0.47$, and $g = 20$ mm.

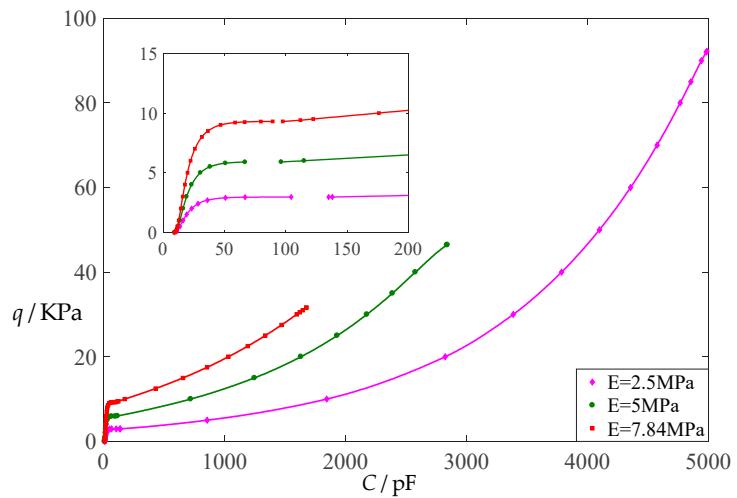

Figure S9. The capacitance-pressure relationships of a circular capacitive pressure sensor from non-touch mode of operation to touch mode of operation, where $a = 100 \text{ mm}$, $h = 1 \text{ mm}$, $t = 0.1 \text{ mm}$, $E = 7.84 \text{ MPa}$, 5 MPa and 2.5 MPa , $\nu = 0.47$, and $g = 30 \text{ mm}$.

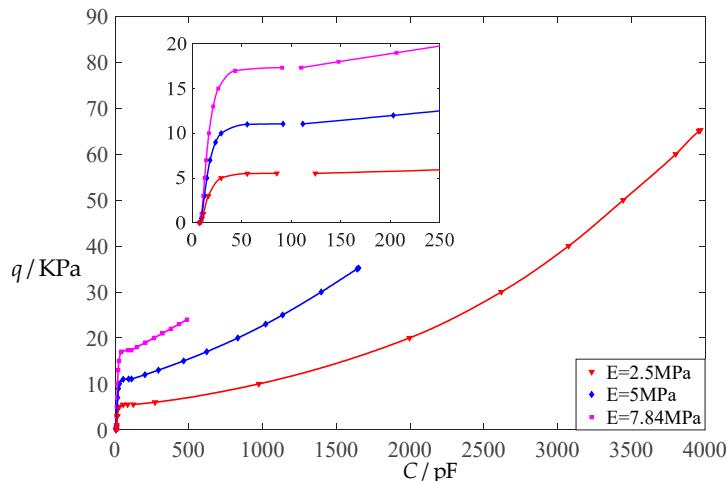

Figure S10. The capacitance-pressure relationships of a circular capacitive pressure sensor from non-touch mode of operation to touch mode of operation, where $a = 100 \text{ mm}$, $h = 1 \text{ mm}$, $t = 0.1 \text{ mm}$, $E = 7.84 \text{ MPa}$, 5 MPa and 2.5 MPa , $\nu = 0.47$, and $g = 37 \text{ mm}$.

S.6. Effect of Thickness of Insulator Layer on Capacitance–Pressure Relationships

In this section, the insulator layer thickness t is first increased from the reference value $t = 0.1 \text{ mm}$ to $t = 0.15 \text{ mm}$, and then further to $t = 0.3 \text{ mm}$. The initial air parallel gap g still takes 10 mm, 20 mm, 30 mm and 37 mm. The calculation results are listed in Tables S41–S48 when $t = 0.15 \text{ mm}$, and in Tables S49–S56 when $t = 0.3 \text{ mm}$. Figure S11 shows the input capacitance–output pressure relationships for $g = 10 \text{ mm}$ and $t = 0.1 \text{ mm}$, 0.15 mm and 0.3 mm , Figure S12 for $g = 20 \text{ mm}$ and $t = 0.1 \text{ mm}$, 0.15 mm and 0.3 mm , Figure S13 for $g = 30 \text{ mm}$ and $t = 0.1 \text{ mm}$, 0.15 mm and 0.3 mm , and Figure S14 for $g = 37 \text{ mm}$ and $t = 0.1 \text{ mm}$, 0.15 mm and 0.3 mm .

From Figures S11–S14 it can clearly be seen that increasing the insulator layer thickness t can only increase the range of the input capacitance C , but the range of the output pressure q is almost unchanged. Therefore, increasing the insulator layer thickness t can decrease the output pressure per unit capacitance, because the range of the input capacitance C increases while the range of the output pressure q remains constant. For instance, as the Young's modulus of elasticity E decreases from 7.84 MPa to 5 MPa and then to 2.5 MPa, the output pressure per unit capacitance for $g = 10 \text{ mm}$ increases from 0.029 KPa/pF to 0.043 KPa/pF and then to 0.083 KPa/pF, that for $g = 20 \text{ mm}$ increases from 0.015 KPa/pF to 0.022 KPa/pF and then to 0.039 KPa/pF, that for $g = 30 \text{ mm}$ increases from 0.019 KPa/pF to 0.026 KPa/pF and then to 0.042 KPa/pF, and that for $g = 37 \text{ mm}$ increases from 0.050 KPa/pF to 0.063 KPa/pF and then to 0.89 KPa/pF, which are calculated from Tables S1–S8 and S41–S56.

Table S41. The calculation results of a circular capacitive pressure sensor operating in non-touch mode, where $a = 100 \text{ mm}$, $h = 1 \text{ mm}$, $t = 0.15 \text{ mm}$, $E = 7.84 \text{ MPa}$, $\nu = 0.47$, and $g = 10 \text{ mm}$.

Figure S11. The capacitance-pressure relationships of a circular capacitive pressure sensor from non-touch mode of operation to touch mode of operation, where $a = 100$ mm, $h = 1$ mm, $t = 0.1$ mm, 0.15 mm and 0.3 mm, $E = 7.84$ MPa, $\nu = 0.47$, and $g = 10$ mm, (a) Overall; (b) Local.

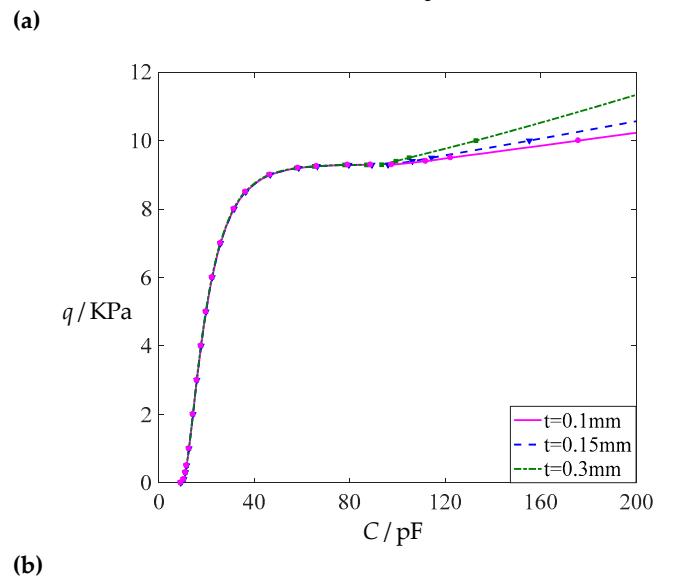

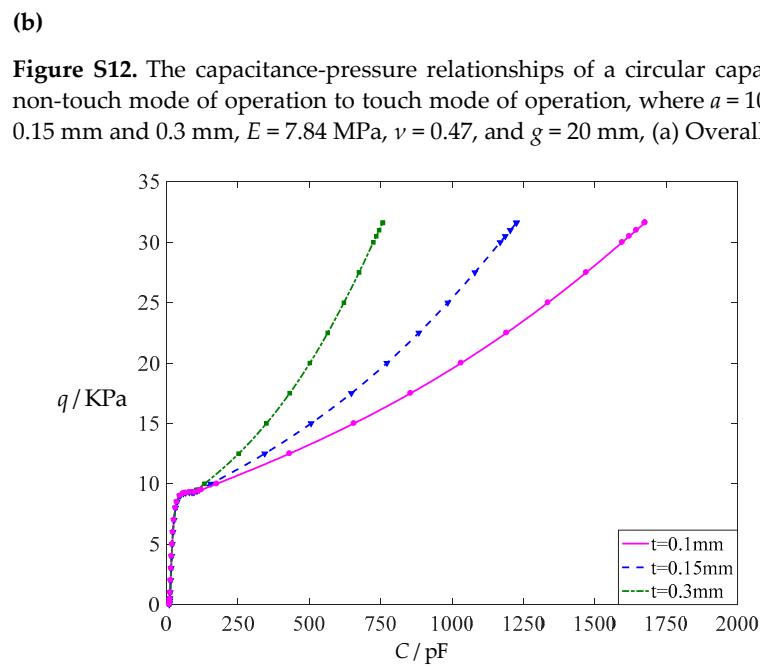

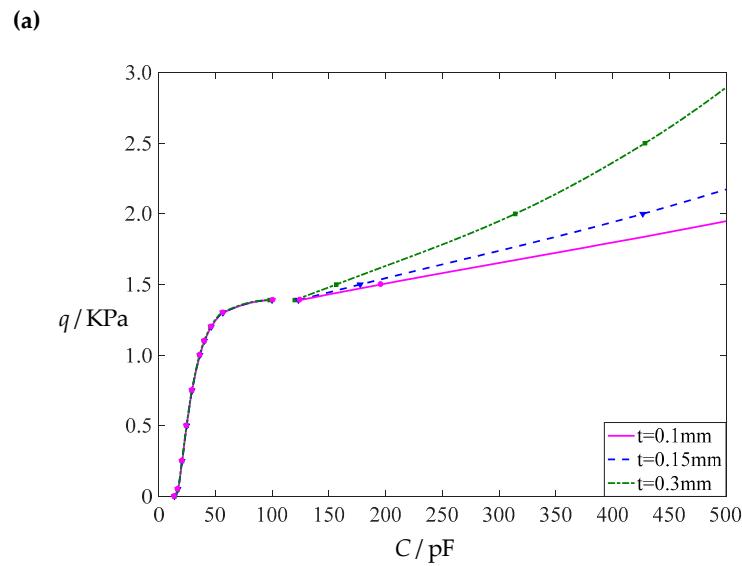

Figure S13. The capacitance-pressure relationships of a circular capacitive pressure sensor from non-touch mode of operation to touch mode of operation, where $a = 100 \text{ mm}$, $h = 1 \text{ mm}$, $t = 0.1 \text{ mm}$, 0.15 mm and 0.3 mm , $E = 7.84 \text{ MPa}$, $\nu = 0.47$, and $g = 30 \text{ mm}$, (a) Overall; (b) Local.

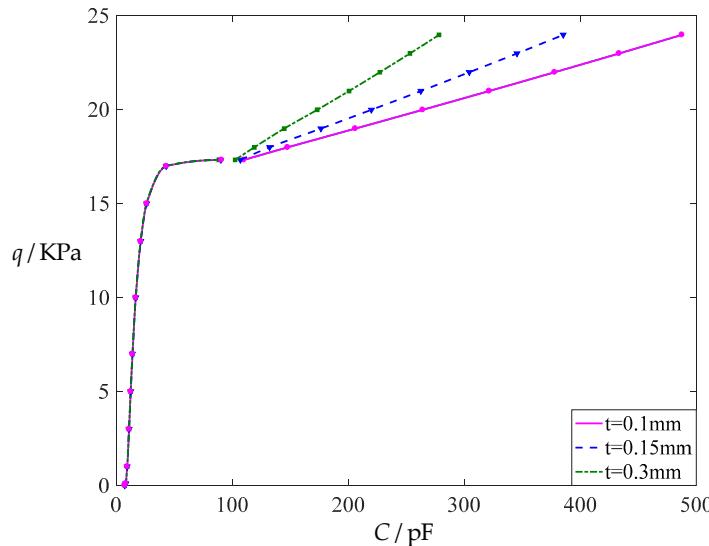

Figure S14. The capacitance-pressure relationships of a circular capacitive pressure sensor from non-touch mode of operation to touch mode of operation, where $a = 100 \text{ mm}$, $h = 1 \text{ mm}$, $t = 0.1 \text{ mm}$, 0.15 mm and 0.3 mm , $E = 7.84 \text{ MPa}$, $\nu = 0.47$, and $g = 37 \text{ mm}$.

S.7. Effect of Membrane Radius on Capacitance–Pressure Relationships

In this section, the radius a of the circular conductive membrane is first decreased from the reference value $a = 100 \text{ mm}$ to $a = 50 \text{ mm}$, and then further to $a = 10 \text{ mm}$. The initial air parallel gap g takes 5 mm , 10 mm , 15 mm and 18.5 mm for $a = 50 \text{ mm}$, and takes 1 mm , 2 mm , 3 mm and 3.7 mm for $a = 10 \text{ mm}$. The calculation results are listed in Tables S57–S64 when $a = 50 \text{ mm}$, and in Tables S65–S72 when $a = 10 \text{ mm}$. Figure S15 shows the input capacitance–output pressure relationships for $a = 100 \text{ mm}$ and $g = 10 \text{ mm}$, $a = 50 \text{ mm}$ and $g = 5 \text{ mm}$, and $a = 10 \text{ mm}$ $g = 1 \text{ mm}$, Figure S16 for $a = 100 \text{ mm}$ and $g = 20 \text{ mm}$, $a = 50 \text{ mm}$ and $g = 10 \text{ mm}$, and $a = 10 \text{ mm}$ $g = 2 \text{ mm}$, Figure S17 for $a = 100 \text{ mm}$ and $g = 30 \text{ mm}$, $a = 50 \text{ mm}$ and $g = 15 \text{ mm}$, and $a = 10 \text{ mm}$ $g = 3 \text{ mm}$, and Figure S18 for $a = 100 \text{ mm}$ and $g = 37 \text{ mm}$, $a = 50 \text{ mm}$ and $g = 18.5 \text{ mm}$, and $a = 10 \text{ mm}$ $g = 3.7 \text{ mm}$.

from Figures S15–S18 it can clearly be seen that decreasing the membrane radius a can increase the range of the output pressure q but decreases the range of the input capacitance C . Therefore, decreasing the membrane radius a can greatly increase the output pressure per unit capacitance, because the range of the output pressure q increases since the thickness h of the circular conductive membrane is kept constant at 1 mm , while the range of the input capacitance C is greatly decreased since the area of the circular conductive membrane (movable electrode plate) is greatly reduced. For instance, as the membrane radius a decreases from 100 mm to 50 mm and then to 10 mm , the output pressure per unit capacitance increases from 0.029 KPa/pF to 0.228 KPa/pF and then to 21.385 KPa/pF for $a = 100 \text{ mm}$ and $g = 10 \text{ mm}$, $a = 50 \text{ mm}$ and $g = 5 \text{ mm}$, and $a = 10 \text{ mm}$ $g = 1 \text{ mm}$, from 0.015 KPa/pF to 0.120 KPa/pF and then to 10.541 KPa/pF for $a = 100 \text{ mm}$ and $g = 20 \text{ mm}$, $a = 50 \text{ mm}$ and $g = 10 \text{ mm}$, and $a = 10 \text{ mm}$ $g = 2 \text{ mm}$, from 0.019 KPa/pF to 0.146 KPa/pF and then to 11.029 KPa/pF for $a = 100 \text{ mm}$ and $g = 30 \text{ mm}$, $a = 50 \text{ mm}$ and $g = 15 \text{ mm}$, and $a = 10 \text{ mm}$ $g = 3 \text{ mm}$, and from 0.050 KPa/pF to 0.345 KPa/pF and then to 18.647 KPa/pF for $a = 100 \text{ mm}$ and $g = 37 \text{ mm}$, $a = 50 \text{ mm}$ and $g = 18.5 \text{ mm}$, and $a = 10 \text{ mm}$ $g = 3.7 \text{ mm}$, which are calculated from Tables S1–S8 and S57–S72.

Table S57. The calculation results of a circular capacitive pressure sensor operating in non-touch mode, where $a = 50 \text{ mm}$, $h = 1 \text{ mm}$, $t = 0.1 \text{ mm}$, $E = 7.84 \text{ MPa}$, $\nu = 0.47$, and $g = 5 \text{ mm}$.
