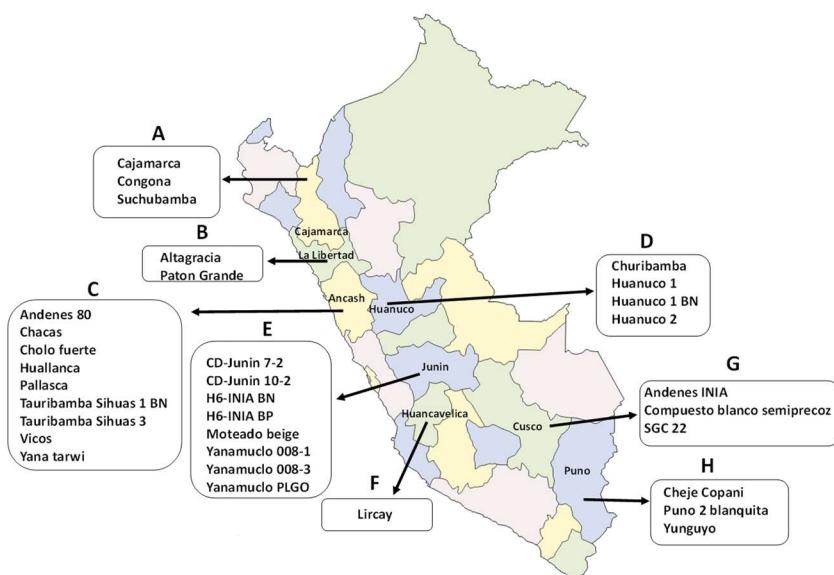

Figure S1. Areas of origin of the 33 *Lupinus mutabilis* ecotypes analysed.

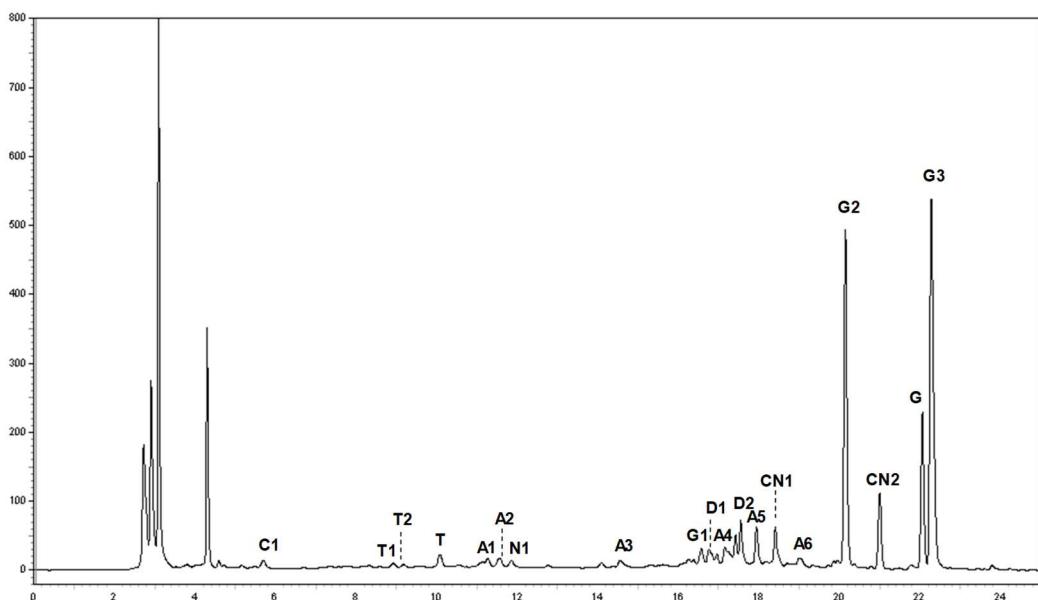

Figure S2. HPLC chromatogram at 280 nm of the free phenolics in one *Lupinus mutabilis* ecotype. A1-A6, apigenin derivatives; C1, catechin derivative; CN1-CN2, cinammic acid derivatives; D1-D2, diosmin derivatives; G, genistein; G1-G3, genistein derivatives; N1, naringenin derivative; T, tyrosol; T1-T2, tyrosol derivative. Apigenin derivatives are read at 320 nm while diosmin derivatives at 360 nm.

Table S1. *Lupinus mutabilis* ecotypes and other *Lupinus* species tested, and their area of origin (see also Figure S1).
