

# Supplementary material - Tables with estimates for CapEx and OpEx of gasification technologies

Determining the best approach for biomass gasification can be challenging due to the many factors that must be considered, including cost, performance, syngas composition, and final application. The following is a series of tables highlighting the trade-offs between different options, allowing users to identify the most suitable combinations for their needs and circumstances. While these tables can provide estimates for CapEx and OpEx for a hypothetical gasification plant, it is important to note that actual costs will depend on a wide range of factors, including the specific design and location of the system, the type and quality of feedstock used, and prevailing economic conditions.
