Tables S1 to S7

Table S1. Summary of six curve fitting methods in determining start of the growing season (SOS) from satellite-derived NDVI data.

Method	curve fitting function
AG	$\text{NDVI}(t) = \begin{cases} g_1 + g_2 e^{-\frac{(t-n_1)^{n_3}}{n_2}} & \text{if } t > n_1 \\ g_1 + g_2 e^{-\frac{(n_1-t)^{n_5}}{n_4}} & \text{if } t \leq n_1 \end{cases}$
Beck	$\text{NDVI}(t) = m_1 + m_2 \left(\frac{1}{1+e^{m_3-m_4t}} - \frac{1}{1+e^{m_5-m_6t}} \right)$
Elmore	$\text{NDVI}(t) = m_1 + (m_2 - m_7t) \left(\frac{1}{1+e^{(m'_3-t)/m'_4}} - \frac{1}{1+e^{(m'_5-t)/m'_6}} \right)$
Gu	$\text{NDVI}(t) = k_1 + \frac{k_2}{(1+e^{l_1-l_2t})^{u_1}} - \frac{k_3}{(1+e^{l_3-l_4t})^{u_2}}$
Klos	$\text{NDVI}(t) = (a_1t + b_1) + (a_2t^2 + b_2t + c) \left(\frac{1}{(1+q_1e^{d_1-d_2t})^{v_1}} - \frac{1}{(1+q_2e^{d_3-d_4t})^{v_2}} \right)$
Zhang	$\text{NDVI}(t) = \frac{c_3}{1+e^{c_1+c_2t}} + c_4$

In the curve filter function, t is the Julian date, NDVI(t) is the fitted NDVI value by the equation of each filter function and the others are parameters to be fitted.

Table S2. Temporal trends of the start of the growing season (SOS) for the three vegetation types: mixed forest (MF), grasslands (GL), and barren or sparsely vegetated land (BOSV). The percentages represent the percentage of pixels with advanced or delayed SOS (percentage of pixels with p value < 0.05 in parentheses).

Vegetation types	1982-1998		1998-2015		1982-2015	
	Advance (%)	Delay (%)	Advance (%)	Delay (%)	Advance (%)	Delay (%)
MF	86.6 (21.9)	13.4 (0.4)	55.5 (8.4)	44.5 (2.7)	87.2 (53.1)	12.8 (1.8)
GL	59.9 (10.6)	40.1 (5.0)	45.2 (5.5)	54.8 (8.8)	60.0 (17.7)	40.0 (10.0)
BOSV	53.0 (5.3)	47.0 (3.8)	30.3 (3.7)	69.7 (13.2)	52.8 (12.8)	47.2 (12.2)

Table S3. Changes in climate extremes indices over the period 1982-2015. Negative means that the climate extremes indices decrease with the year (percentage of pixels with P < 0.05 in parentheses), while positive means that it increases with the year. The values in the table are the percentage of the trend.
