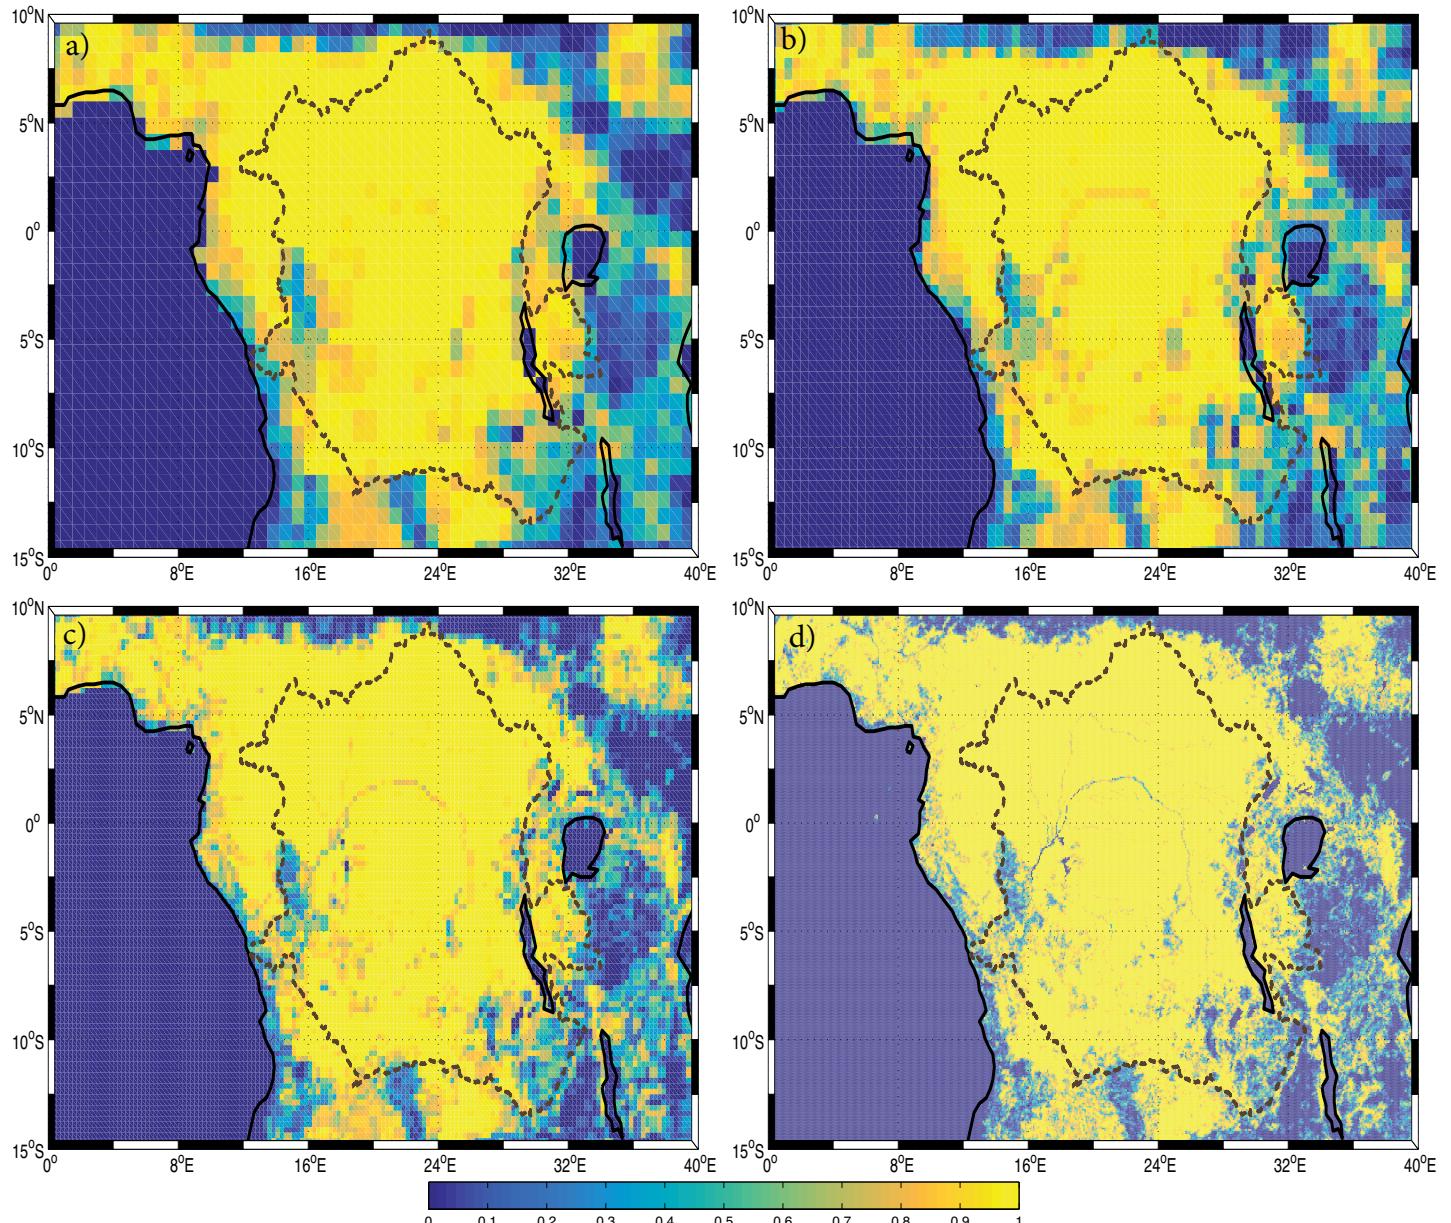

Figure S1: Shows the amounts of high vegetation (as a percentage of area covered) for the a) ERA-I; b) EERA5; c) ERA5; and d) ECOA.

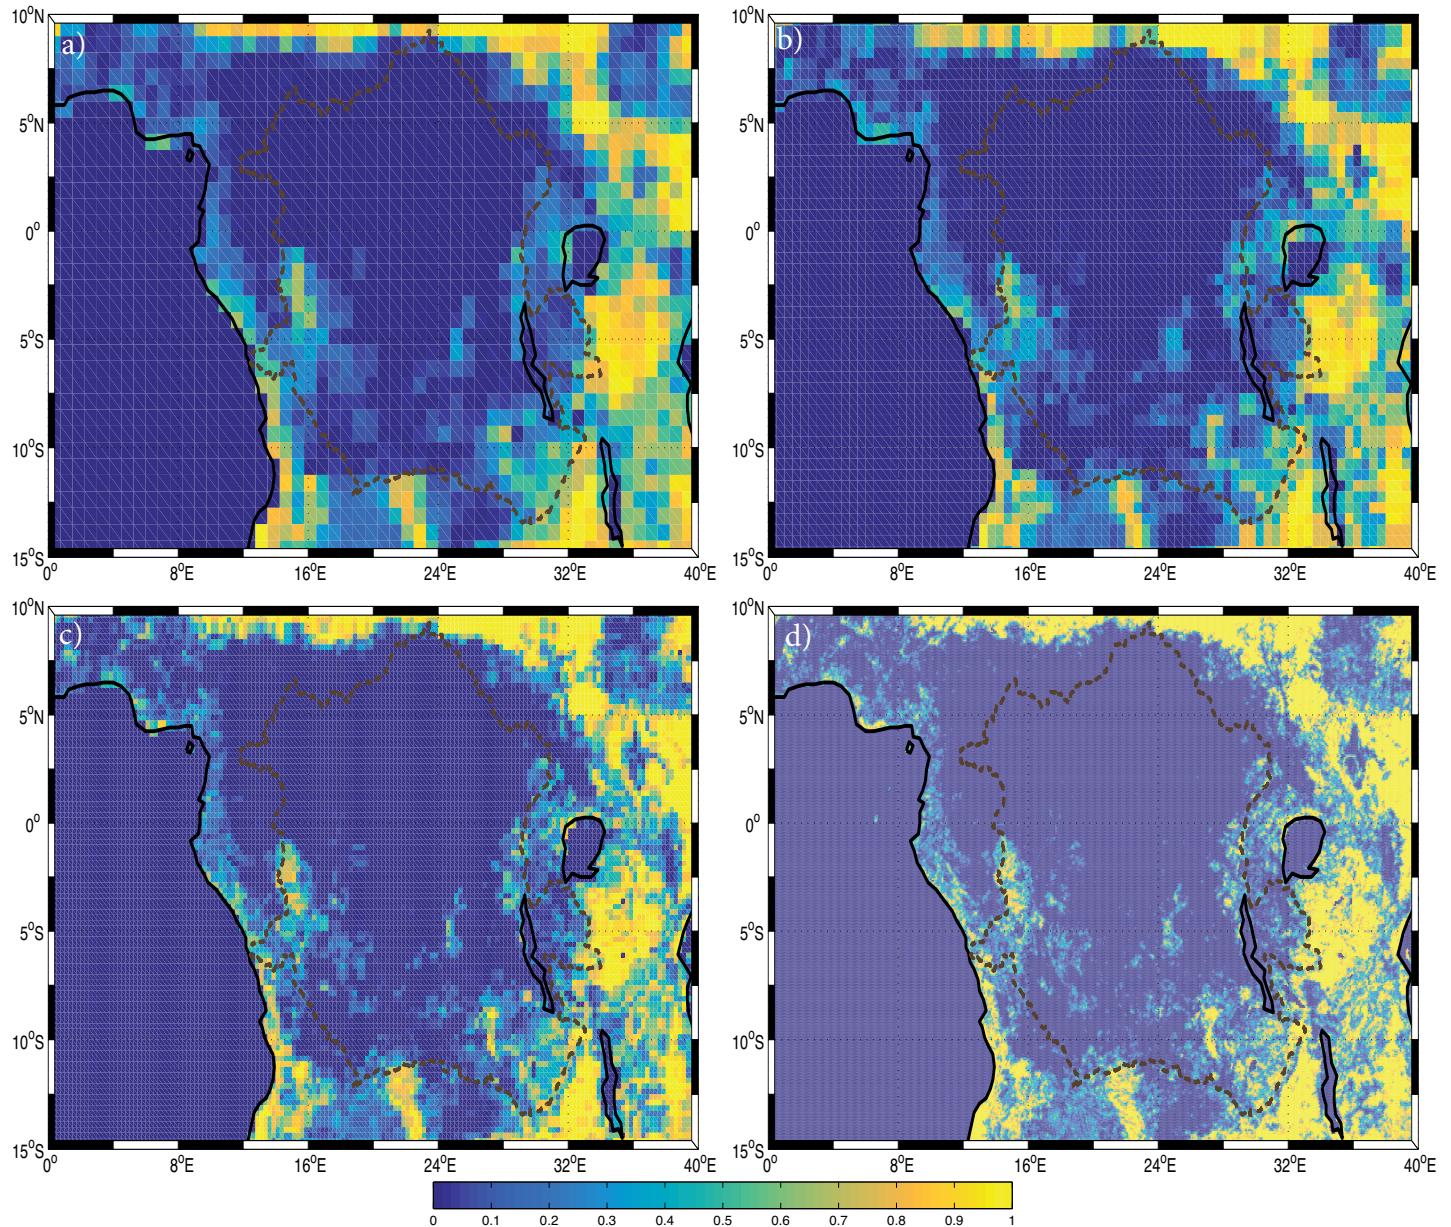

Figure S2: Shows the amounts of low vegetation (as a percentage of area covered) for the a) ERA-I; b) EERA5; c) ERA5; and d) ECOA.

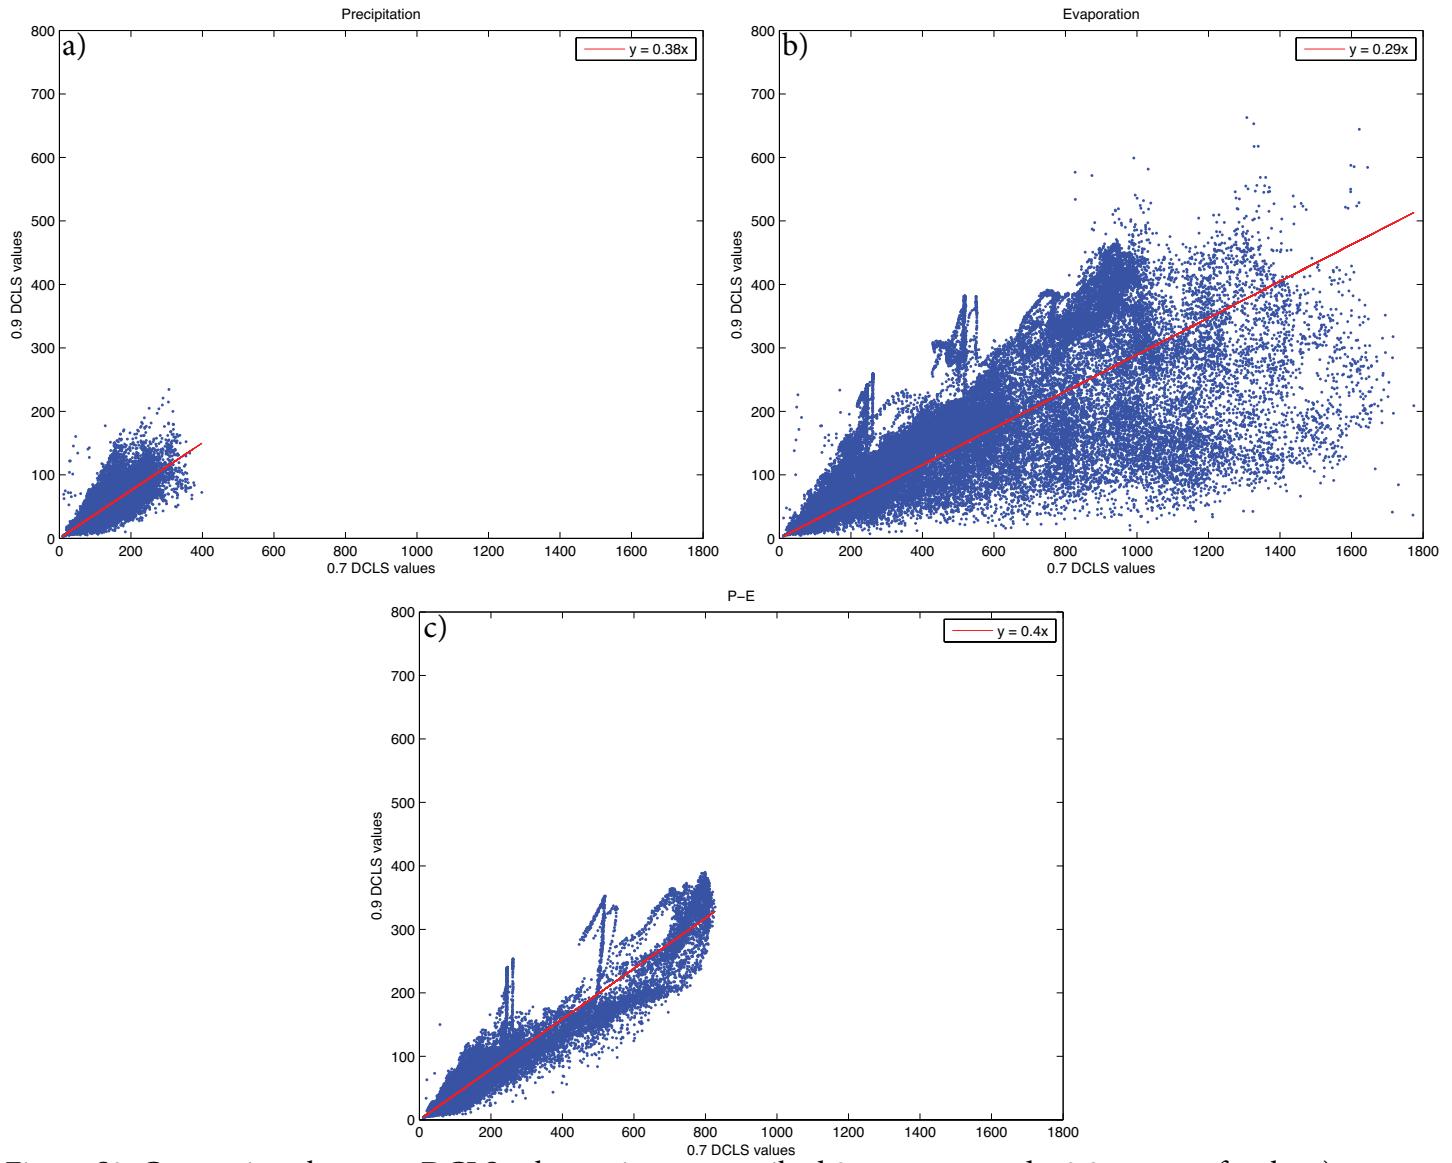

Figure S3: Comparison between DCLS values using a prescribed 0.7 contour and a 0.9 contour for the a) precipitation field, b) evaporation field, and c) the P-E field for the ERA5 dataset over the domain shown in the other figures.

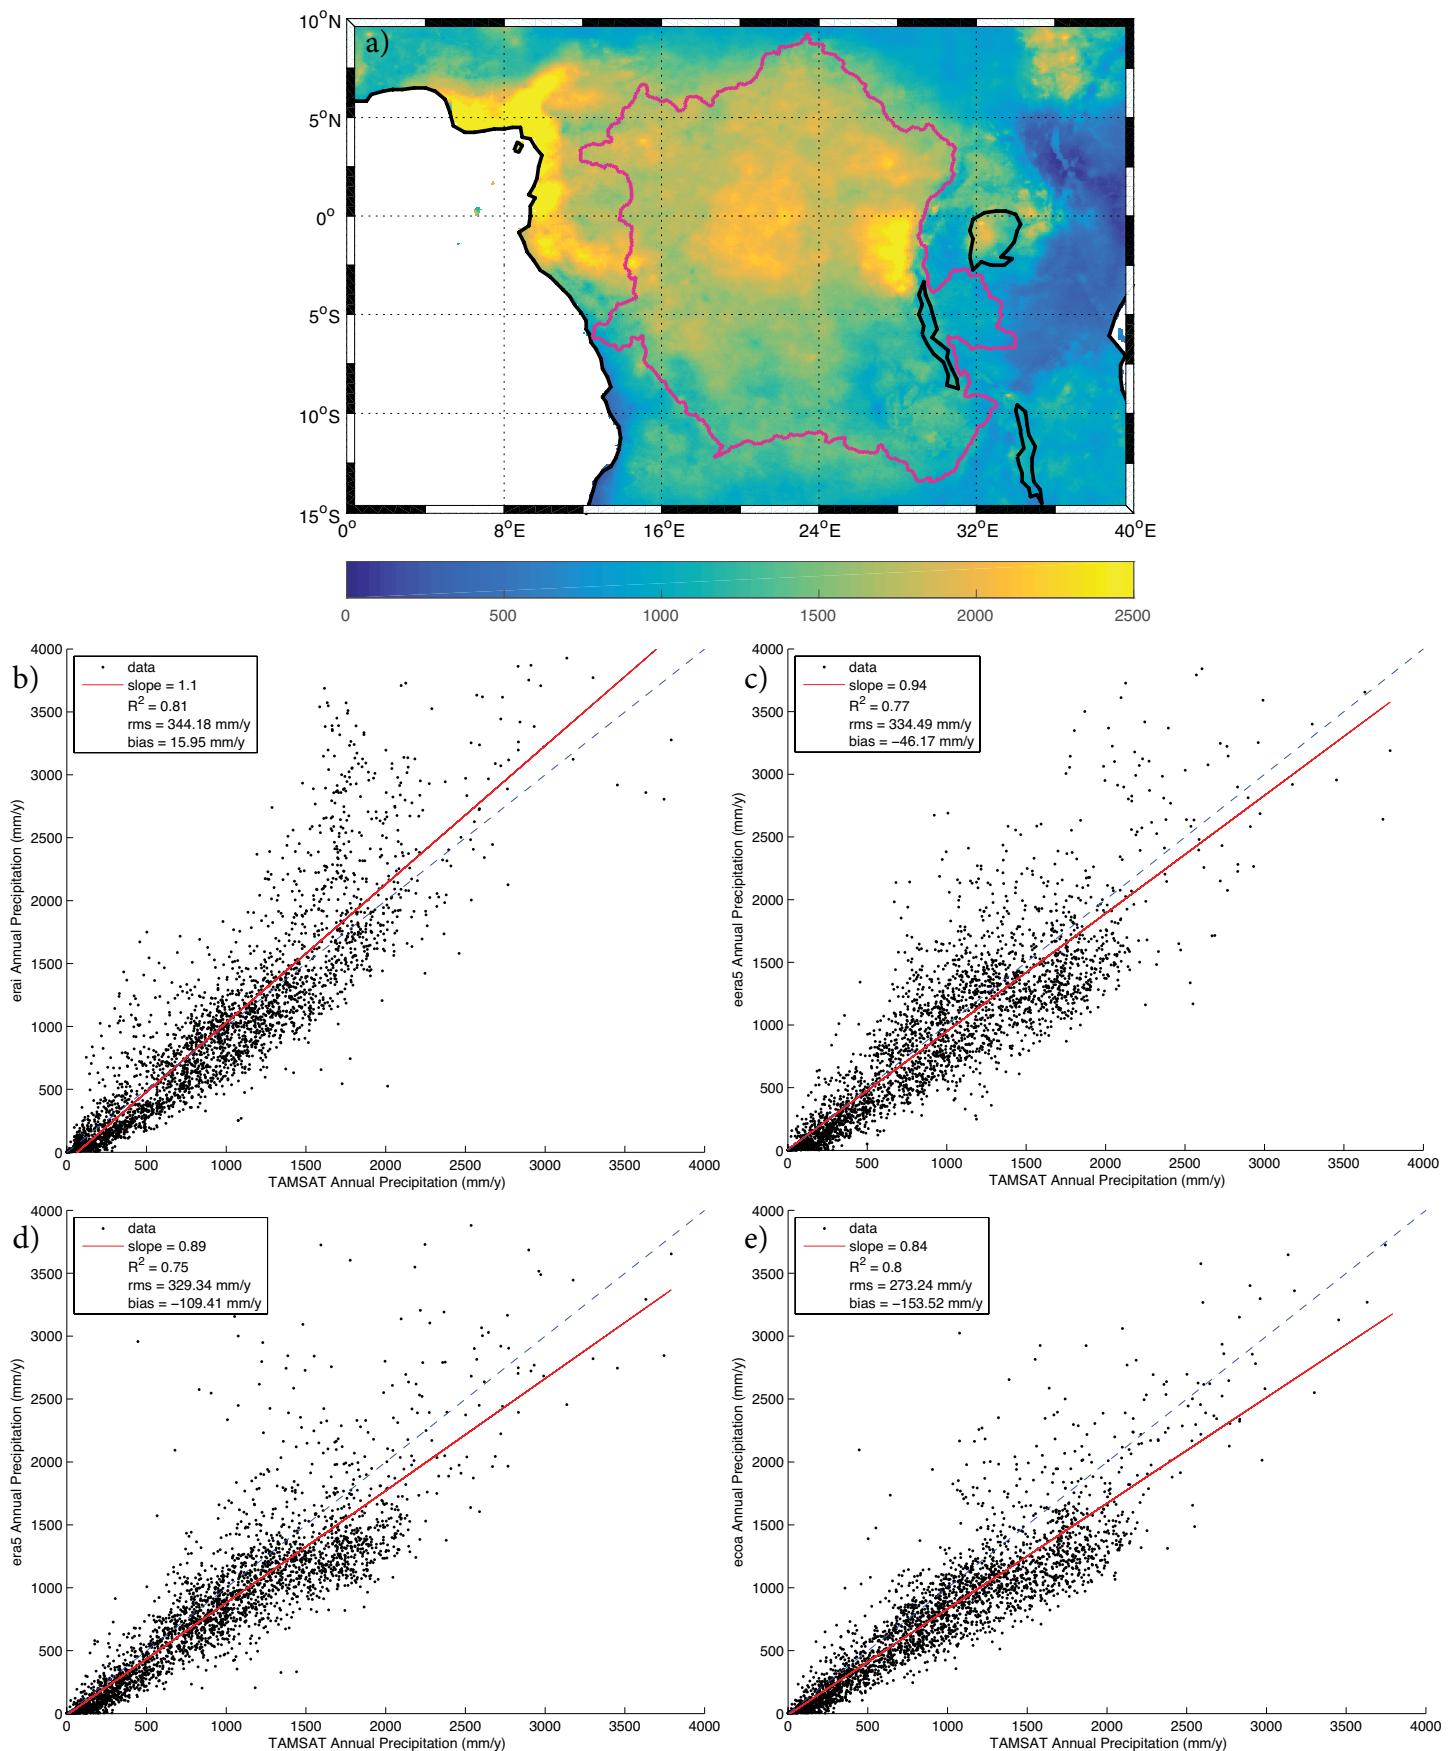

Figure S4: a) Annual mean precipitation (mm/y) from TAMSAT-3 for 2016-2017. Below panel a) are scatter plots comparing TAMSAT-3 precipitation to the b) ERA-I, c) eERA5, d) ERA5, and e) ECOA dataset using common grid points between each of the five datasets. In panels b) - e), the red line is the line of best fit, and the blue dotted line represents the 1-to-1 line.

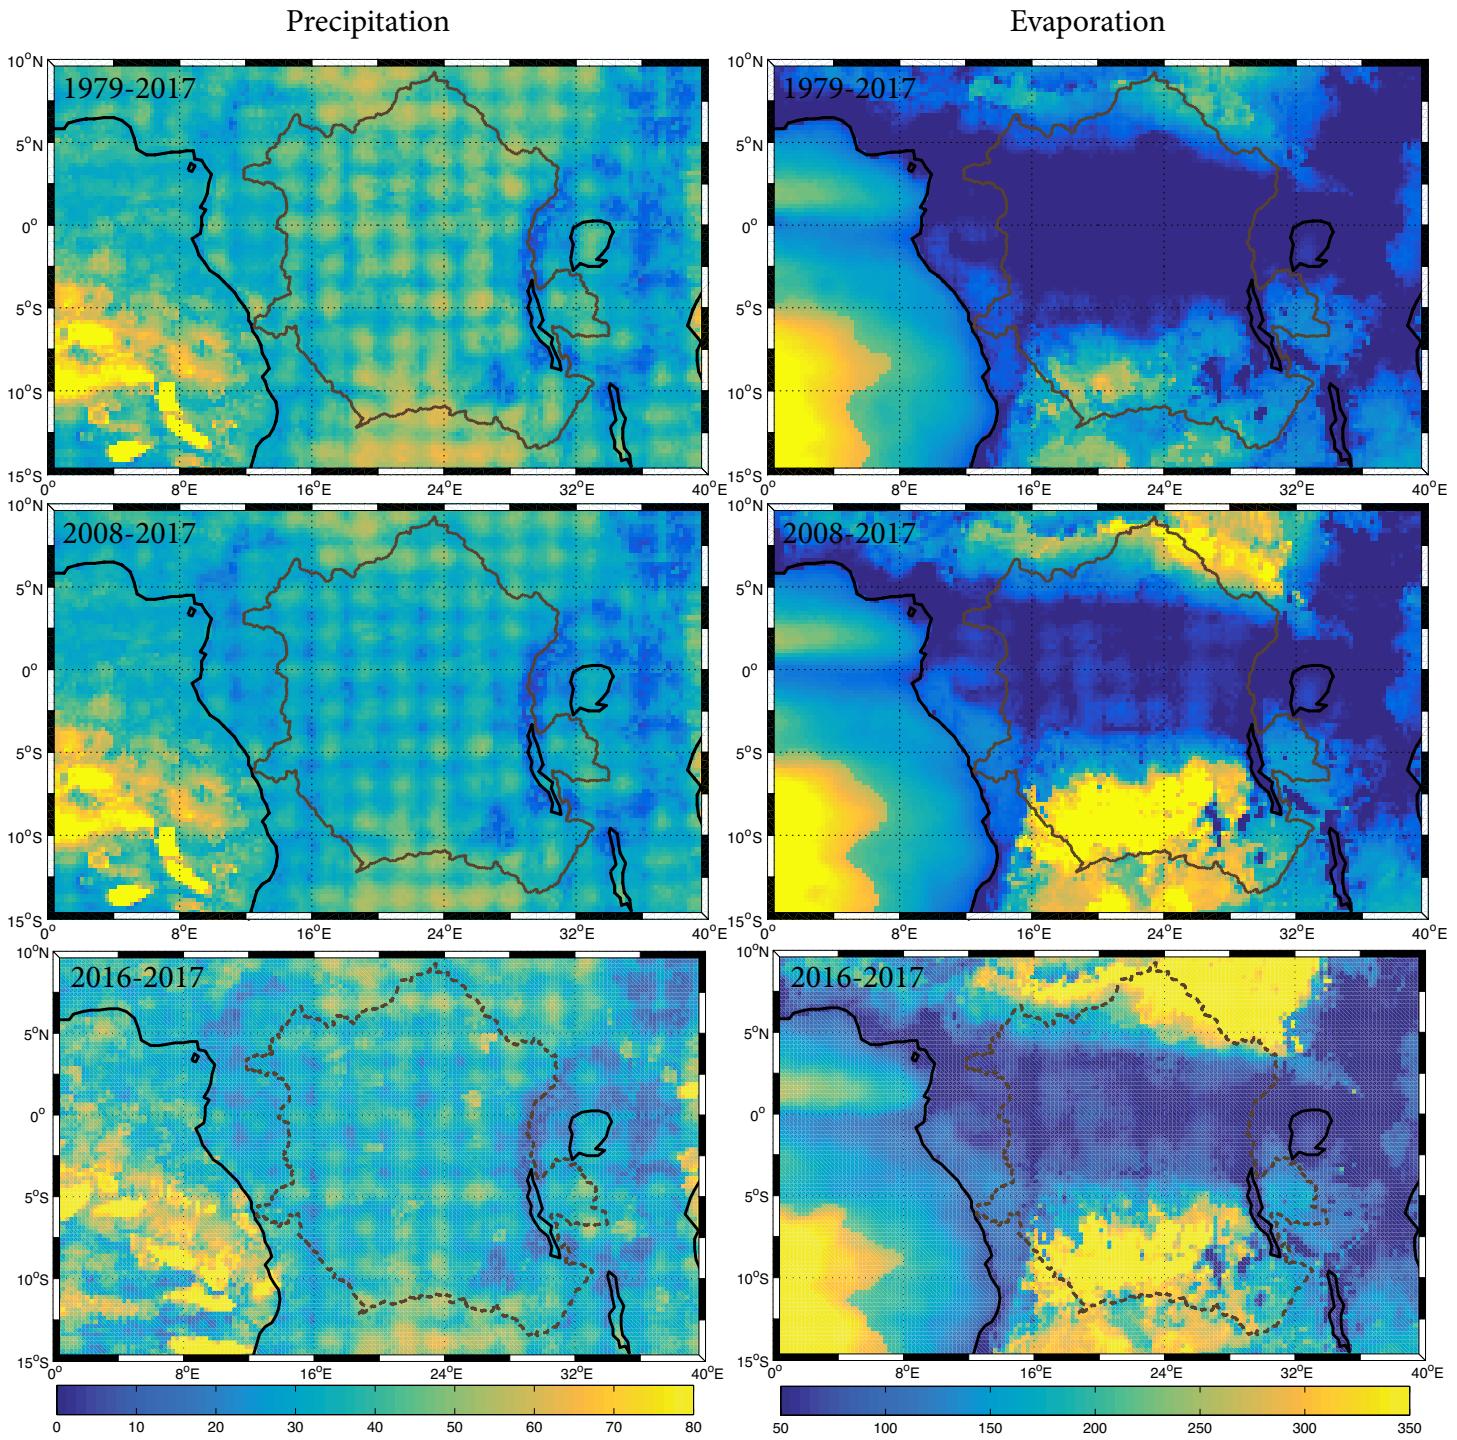

Figure S5a: The decorrelation length scale (km) of the precipitation (left column) and evaporation (right column) from the ERA5 over three different time spans to show convergence of results using only a two-year window.

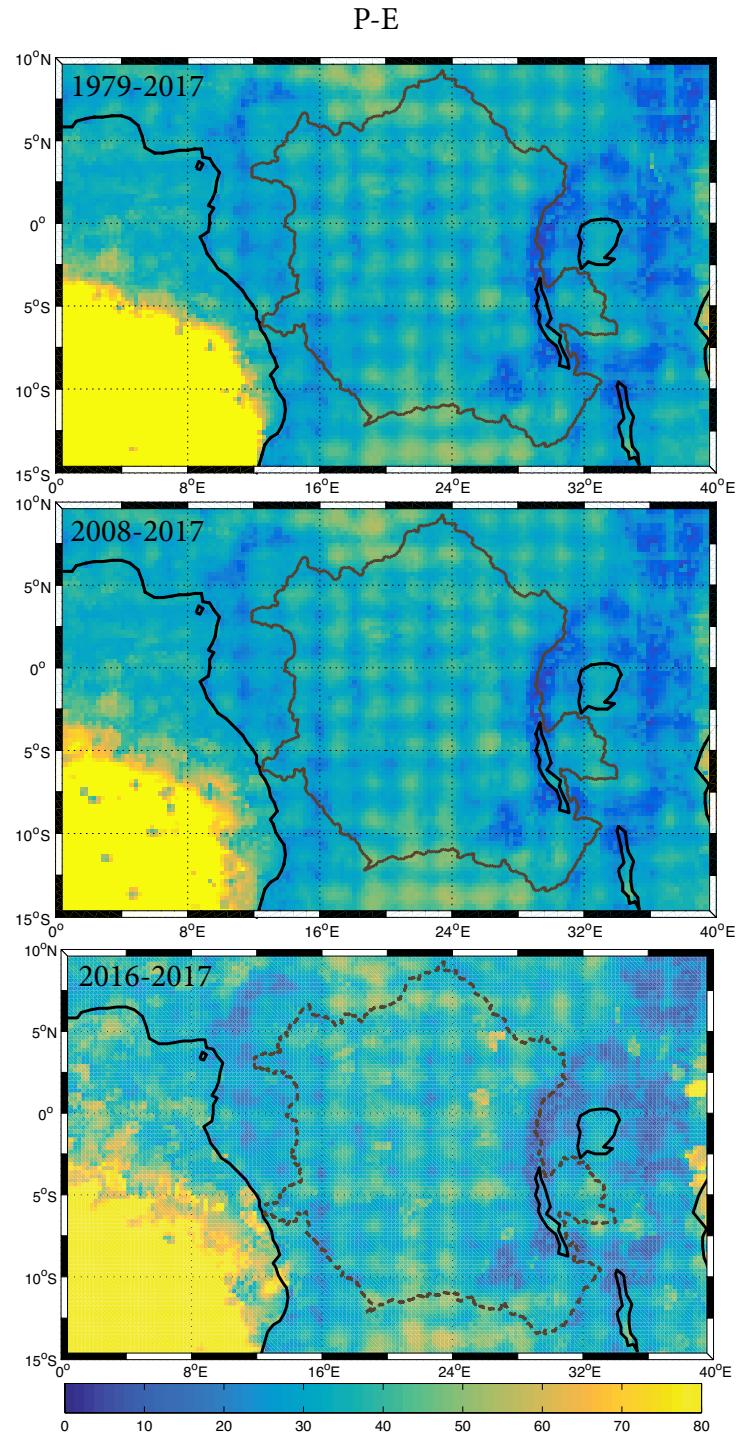

Figure S5b: The decorrelation length scale (km) of the P-E field from the ERA5 over three different time spans to show convergence of results using only a tw-year window.

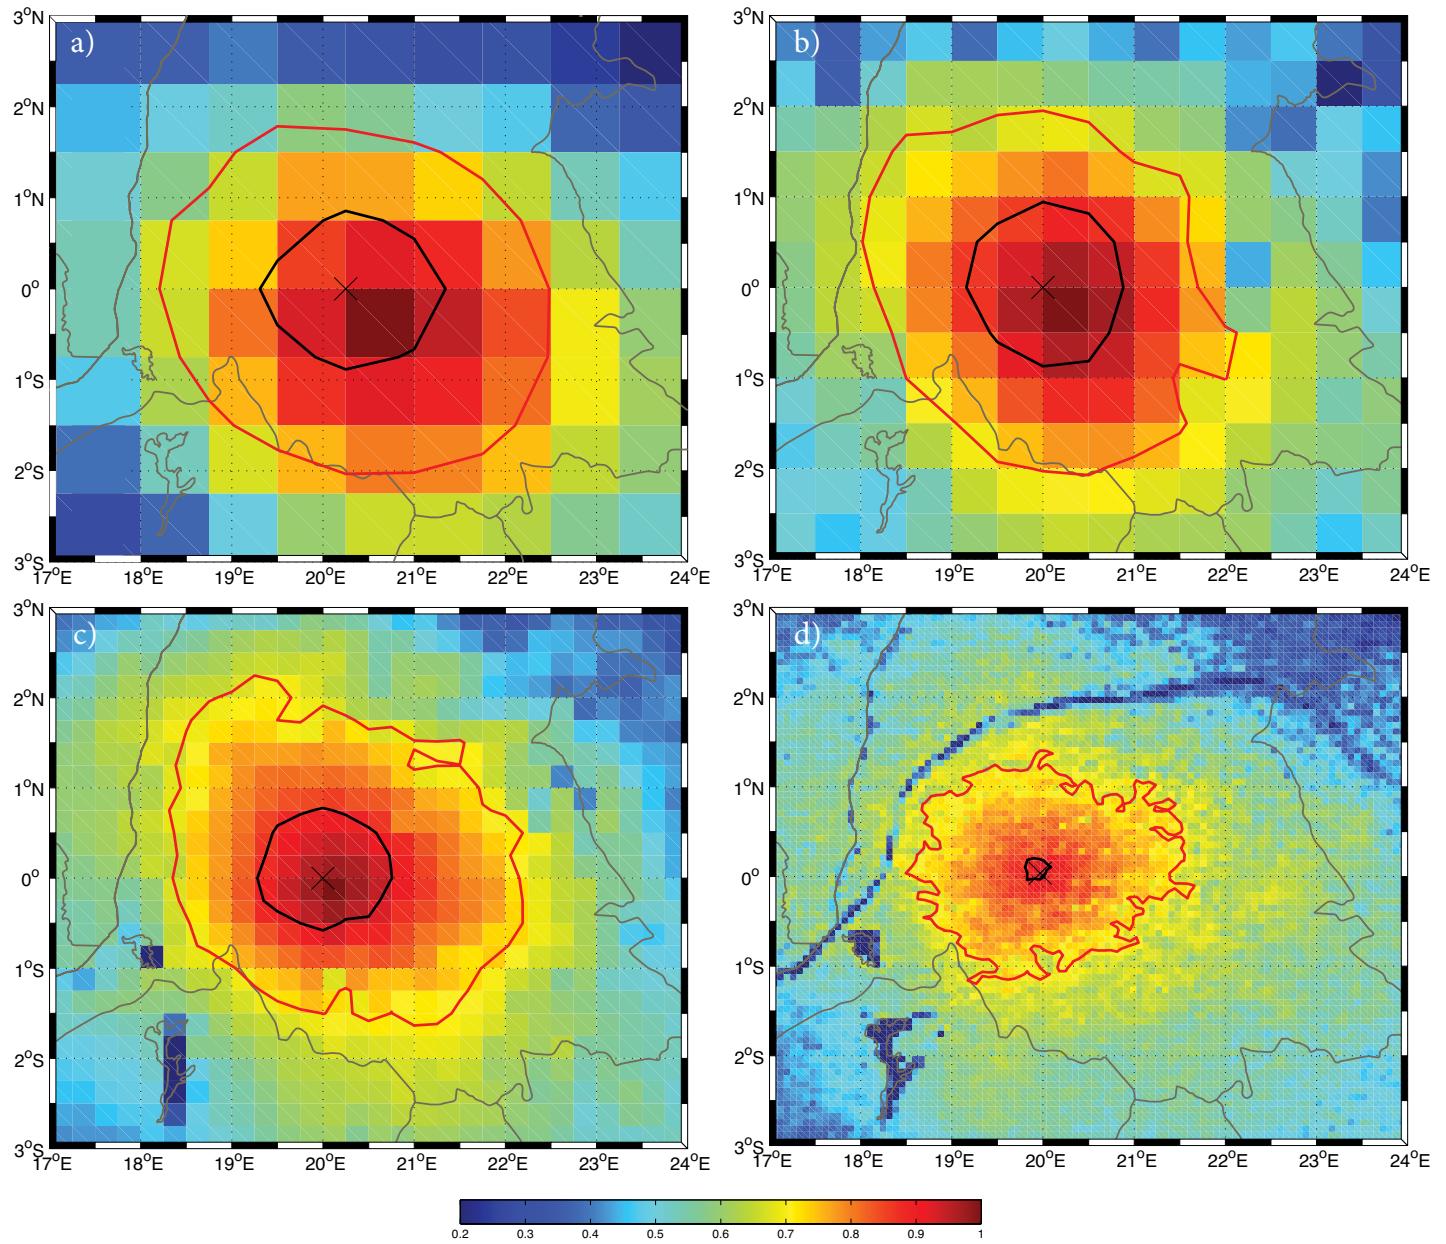

Figure S6: An example of the DCLS calculation of evaporation field for the a) ERA-I; b) EERA5; c) ERA5; and d) ECOA datasets from 2016-2017. The background color represents the correlation coefficient values, and the black contour represents the 0.9 contour level and the red contour represents the 0.7 contour level.

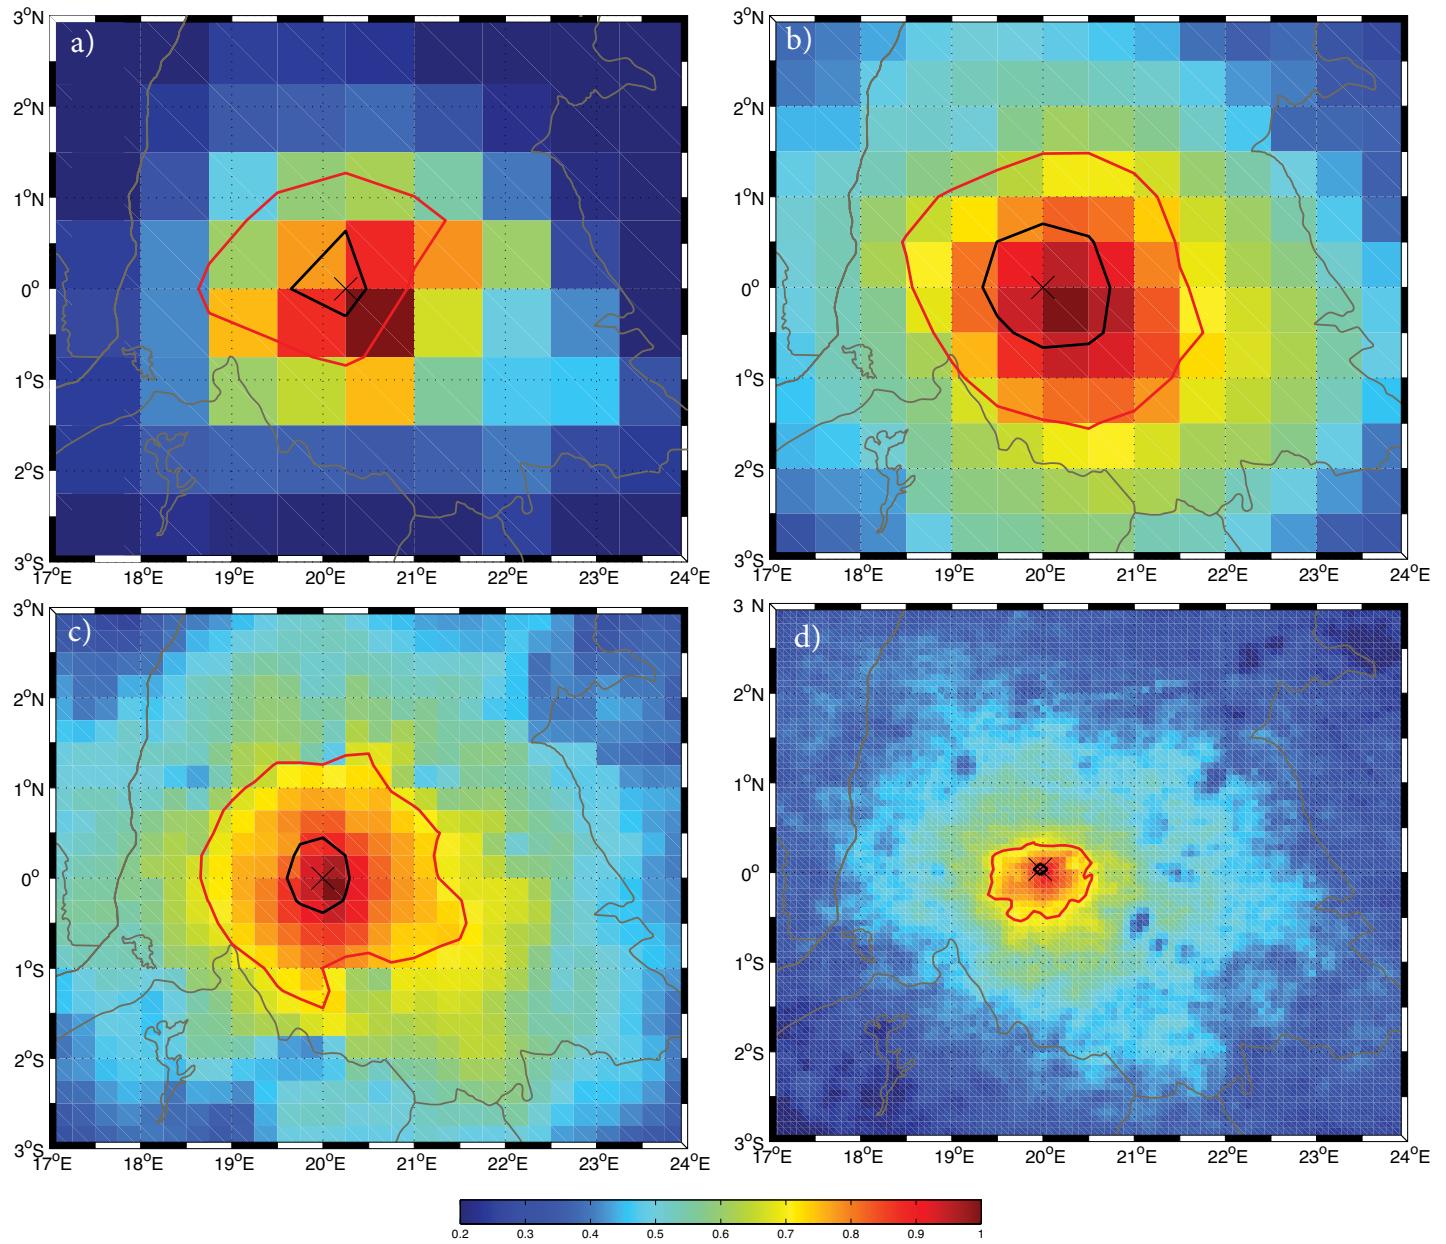

Figure S7: An example of the DCLS calculation of the precipitation field for the a) ERA-I; b) EERA5; c) ERA5; and d) ECOA datasets from 2016-2017. The background color represents the correlation coefficient values, and the black contour represents the 0.9 contour level and the red contour represents the 0.7 contour level.
