Definition of knee angles in the three anatomical planes.

For reference, we report below the definition of the knee angles in the three planes:

- knee flexion: angle between the long axis of the shank and the long axis of the thigh in the sagittal plane;
- knee ab/adduction: angle between the long axis of the thigh and the long axis of the shank in the frontal plane;
- knee rotation: angle between the long axis of the shank and the long axis of the thigh as observed in the transverse plane.

A more detailed description of the angles calculation from the optical motion capture system's manufacturer is available from the documentation (<https://docs.vicon.com/display/Nexus212/Plug-in+Gait+kinematic+variables>).

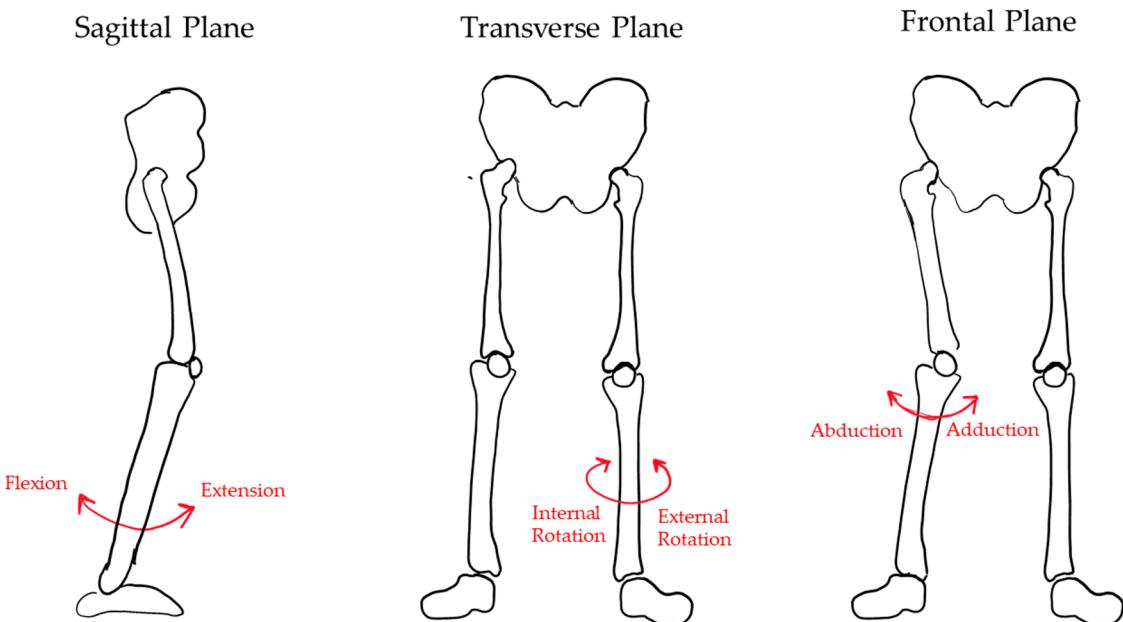

Figure S1: Schematic representation of the knee angles in the three anatomical planes.

Table S1: Regression metrics for all algorithms on single sensors tests.
