

Figure S1. Rarefaction curves for each sample from six groups. (a), the rarefaction curves for each sample of bacterial community; (b), the rarefaction curves for each sample of fungal community. NR: naked rock; LR: lichen-covered rock; BS: bryophyte-covered rock; FS: fern-covered rock; GS: grass-covered rock; SS: shrub-covered rock. The letters stand for the same below.

Table S2. Values of correlation between environmental factors and the communities of bacteria and fungi.

	Bacteria		Fungi	
	$r^2$	$p_{\text{values}}$	$r^2$	$p_{\text{values}}$
TOC	0.7595	0.001	0.7803	0.001
TN	0.5886	0.001	0.8654	0.001

TP	0.5991	0.002	0.7225	0.001
C:N	0.4366	0.013	0.8495	0.001
C:P	0.6962	0.001	0.9242	0.001
N:P	0.2848	0.068	0.9222	0.001
pH	0.6264	0.001	0.6677	0.001

The values of  $r^2$  represent the degree of correlation between environmental factors and community structure and diversity; the  $p$ \_values represent the significance of the correlation degree.  $p > 0.05$ , no significant correlation;  $0.01 < p < 0.05$ , significant correlation;  $p < 0.001$ , highly significant correlation.
