1. Experimental Methods

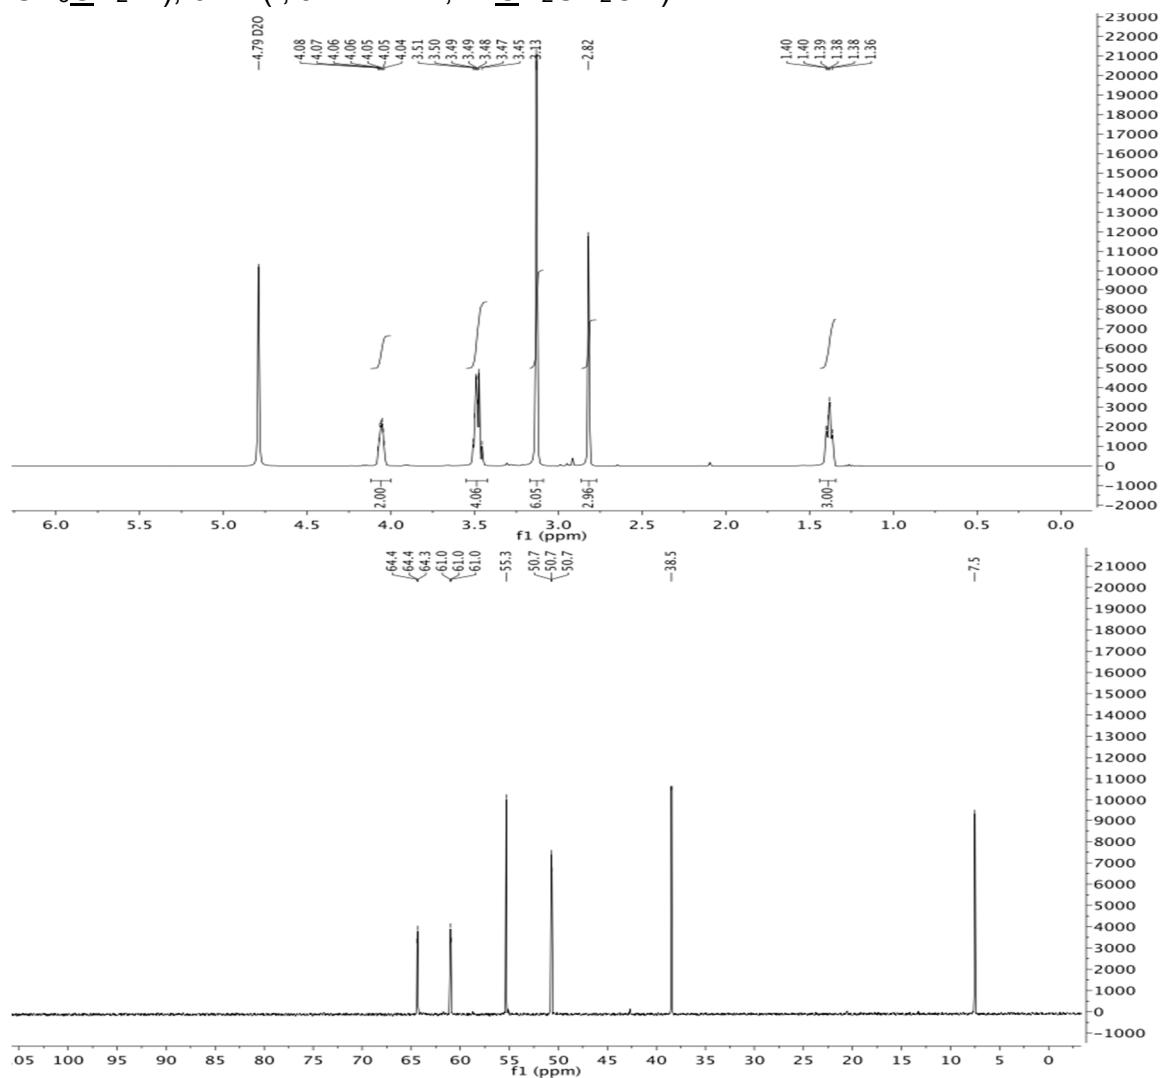

Proton nuclear magnetic resonance (¹H NMR) spectra and carbon nuclear magnetic resonance (¹³C NMR) spectra were recorded on a Bruker Avance III 400 at 400 MHz and 100 MHz, respectively. All spectra were obtained in D₂O, with exception of 2D ¹H-¹H NOESY experiments, which were obtained in dmso-d₆. The NOESY were recorded also at Avance III, 400 MHz with a probe QNP, 400 MHz S₁. Chemical shifts are expressed in ppm and *J* values are given in Hz. Proton chemical shifts are reported with the solvent reference (D₂O, δ 4.79 ppm) or (dmso-d₆, δ 2.50 ppm).

Melting points were determined in a Stuart Scientific Melting Point SPM 1, at rate 3 °C/ min.
