

Table S1. Definition of SUV histogram-based first-order PET parameters.

PET parameters	Definition
Skewness	<p>Asymmetry of the grey-level distribution in the histogram</p> $\text{Skewness} = \frac{[\frac{1}{N} \sum_i (I(i) - \text{Iavg})^3]}{[\frac{1}{N} \sum_i (I(i) - \text{Iavg})^2]^{\frac{3}{2}}}$ <p>I(i) corresponds to the number of voxels with intensity i, N the total number of voxels in the volume of interest, and Iavg the average of grey-levels</p>
Kurtosis	<p>Shape of the grey-level distribution in the histogram relative to a normal distribution</p> $\text{Kurtosis} = \frac{[\frac{1}{N} \sum_i (I(i) - \text{Iavg})^4]}{[\frac{1}{N} \sum_i (I(i) - \text{Iavg})^2]^2}$ <p>I(i) corresponds to the number of voxels with intensity i, N the total number of voxels in the volume of interest, and Iavg the average of grey-levels</p>
Entropy	<p>Randomness of the grey-level distribution in the histogram</p> $\text{Entropy} = - \sum_i p(i) \log_2(p(i) + \varepsilon)$ <p>P(i) is the probability of occurrence of voxels with intensity i and $\varepsilon = 2e - 16$</p>
Energy	<p>Uniformity of the grey-level distribution in the histogram</p> $\text{Energy} = \sum_i p(i)^2$ <p>P(i) is the probability of occurrence of voxels with intensity i</p>
