

Distribution of mutation rate among three dominant variants

Supplementary Figure S1. Kruskal–Wallis test for the significance of mutation rate of three dominant SARS-CoV-2 variants. Mutation rate of the B.1.617.2 Delta variant is significantly higher than the other two dominant variants (tested using the Kruskal–Wallis test, with $p < 0.05$).

Supplementary Figure S2. Visualization of interaction between spike protein of B.1.466.2, B.1.470, and B.1.617.2 variant with ACE2 receptor along with position of mutated residues show in red circles.

Supplementary Table S1 List of SARS-CoV-2 genome sequences from West Java Health Laboratory (WJHL) analyzed in this study. Sequences retrieved from GISAID (<https://www.gisaid.org/>).

Supplementary Table S3. Analysis of mutations found in dominant variants (B.1.466.2, B.1.470 and B.1.617.2) on protein stability. Stability change is shown as $\Delta G_{\text{mutant}} - \Delta G_{\text{wildtype}}$. ($\Delta \Delta G > 0.5$: destabilize; $\Delta \Delta G < -0.5$: stabilize; $-0.5 < \Delta \Delta G < 0.5$: neutral). Mutations in grey are mutations appearing with a prevalence of higher than 90% in each variant (not appearing in all sequences).

Variant	Mutation	$\Delta \Delta G$ Protein (kcal/mol)	Result
