A

B

**Figure S1.** Frequency of human (h) hCD45[+] (left) and, hCD19[+] and hCD3[+] cells (right) were measured 8 weeks following CD34[+] stem cells engraftment but prior to viral challenge. Each dot represents a different mouse, n = 20.
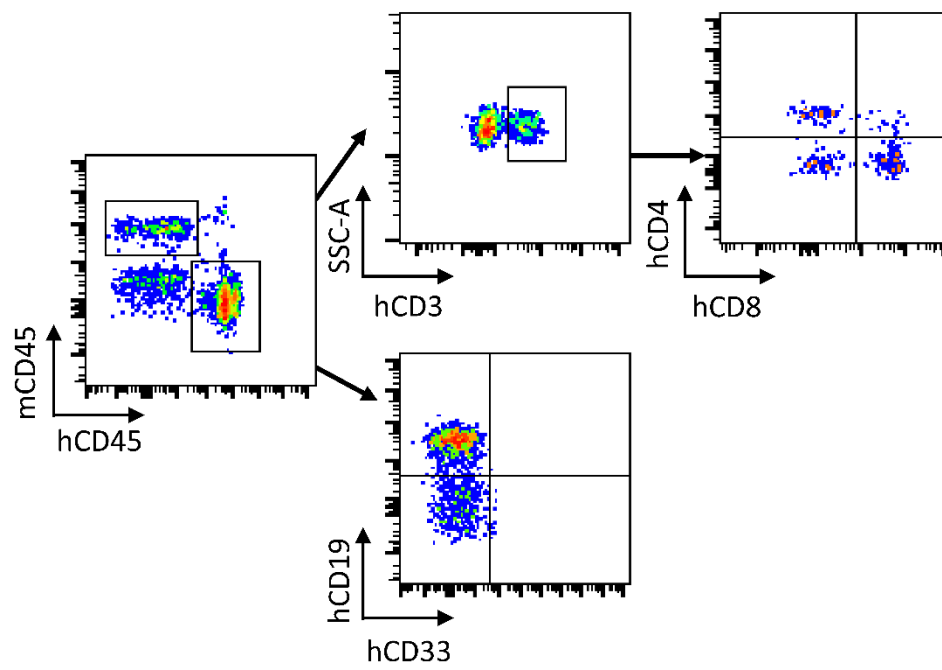

Figure S2. Representative flow plot showing the gating strategy used to analyze peripheral blood.
Figure S3. Splenic lymphocytes were analyzed in EBV-infected humanized mice. The frequency of hCD33+ myeloid cells in spleens at the study endpoint. Data points represent Mean ± SEM of uninfected control mice (n = 3), low (n = 5), medium (n = 3), high (n = 3) doses GRUs of Akata-EBV-GFP infected mice.

Supplementary table

Table S1. Primers for RT-PCR to detect EBV transcripts.

Primer	Sequence (5′→3′)
