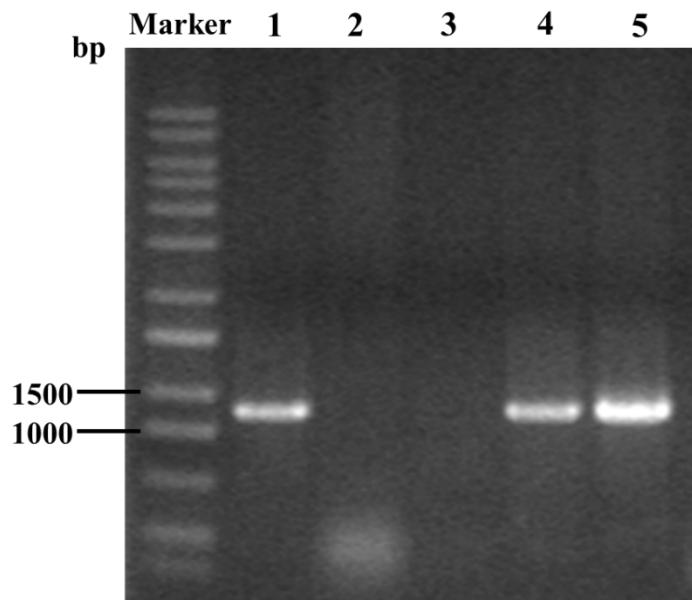

Figure S1. Detection of the PVJ1 genome sequence in the original hydrothermal sediment sample. Metagenomic DNA was prepared from sediment sample GC2, and used as the template for PCR reactions with the primer pair PVJ1-ORF75 F/R. The reaction products were analyzed by agarose gel electrophoresis. Lane 1, metagenomic DNA of GC2; lane 2, metagenomic DNA of SC; lane 3, deionized water; lane 4, genomic DNA of *Psychrobacillus* sp. GC2J1; lane 5, genomic DNA of PVJ1.

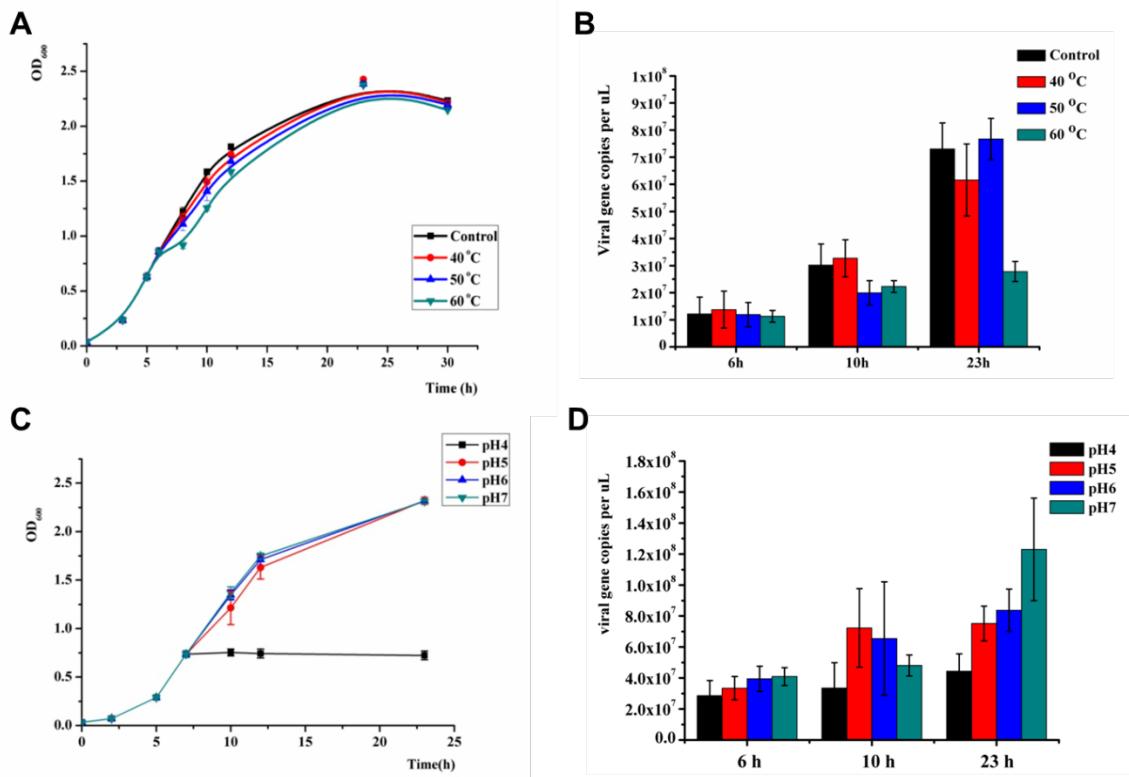

Figure S2. Effects of temperature and pH on the growth of *Psychrobacillus* sp. GC2J1 and the titer of PVJ1. GC2J1 was grown to an OD₆₀₀ of ~0.8 at 25°C and pH7. (A and B) The culture was heat-shocked for 10 min at indicated temperatures and returned to incubation at 25°C. (C and D) The pH of the culture was adjusted to indicated values, and the incubation was continued. The growth of *Psychrobacillus* sp. GC2J1 (A and C) and the PVJ1 titer (B and D) were determined.

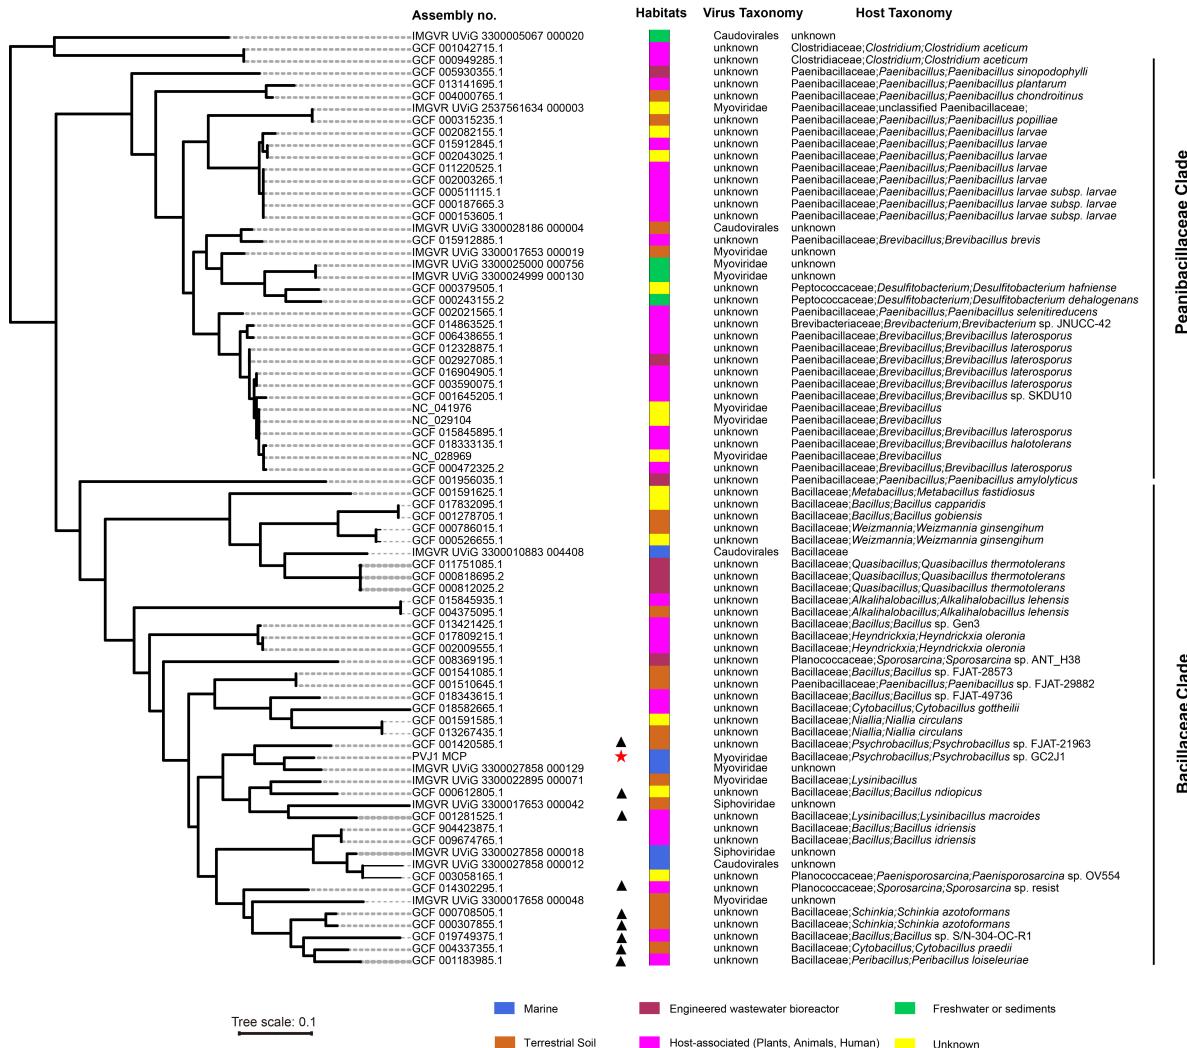

Figure S3. Maximum likelihood (ML) phylogenetic tree of the homologues of PVJ1 MCP.

The tree was constructed based on the amino acid sequences of phage MCPs sharing $\geq 70\%$ identity with PVJ1 MCP. The MCP of PVJ1 is marked with a red star. Phage genomes selected for synteny analysis (Figure 3) are shown by triangles. Habitats from which phage sequences were obtained are indicated. More information on the sequences is in Table S3.
