

SUPPLEMENTARY TABLES

Supplementary table S1. MFI cut-off values calculated with different methods as described in Methods section for the different Ebolavirus strains [Zaire (EBOV). Sudan (SUDV). Bundibugyo (BDBV) and Reston (RESTV)] and the different antigens used per virus. The assay used recombinant proteins of Nucleoprotein (NP). Viral Protein-40 (VP40) or Glycoprotein (GP) for different EBV lineages: Zaire (EBOV). Sudan (SUDV). Bundibugyo (BDBV) and Reston (RESTV). GP proteins from the Mayinga (GP-M) and the Kissidougou (GP-K) strain were used for EBOV. *Mean of negatives was calculated on negative control samples (n=145) that were collected from captive-born insectivorous bats (*Carollia perspicillata*. n=103) hosted at the Zoo of Montpellier. France. and from two frugivorous species (*Pteropus giganteus*. n=19; *Rousettus aegyptiacus*. n=23) from the Zoo of Stuttgart, Germany, as described in De Nys et al, 2018. **The other cut-offs were calculated on a sample set of wild captured bats from Guinea, Cameroon and DRC consisting of DBS samples from 8741 bats as described in Lacroix et al. 2021.

Antigen	Mean+4SD*	mean of the cutoffs**
NP-EBOV	71	196
GP-EBOV-K	128	609
GP- EBOV-M	307	707
VP40-EBOV	75	177
NP-SUDV	131	258
GP-SUDV	251	1896
VP40-SUDV	88	182
GP-BDBV	99	432
VP40-BDBV	363	664
GP-RESTV	249	140

Supplementary Table S2: Distribution of *Eidolon helvum* bats per capture session with respect to sex and age.

Date of sample collection	Adult females		Immature females		Juvenile females		Adult males		Immature males		Juvenile males		Total N
	n	(%)	n	(%)	n	(%)	n	(%)	n	(%)	n	(%)
