

Supplementary information

Table S1. Clinical signs of ranavirosis. A list of clinical signs of ranavirosis that were watched for throughout this study as well as humane end-point checks considered in the thesis by Brookes, 2022 (Brookes, 2022).

Sign	Description
<i>Ranavirosis</i>	
Oedema	The physical appearance of an enlarged area, with tightening of the skin increasing with an increase severity of oedema. Caused by excess fluid acclimating under the skin. Area affected is specific to the anatomy: -dermis around the mandible (offered referred to as lips), floor of oral cavity, dermis around the eye, and broader areas such as the abdomen, drink patch, upper front limbs and upper hindlimbs, digits and cloaca. Blood vesicles will be constricted by the increasing fluid under the skin and will be contributed, appearing bright red. The area affected by oedema may appear both rigid and floppy dependent on where the oedema is. The presence of the fluid can be confirmed by a physical exam or by histopathological assessment.
Tremors	When the amphibian's muscles are in spasm, overtly clear in the hind limbs and sometimes eyes and muscles around the face. Can last for a few seconds and each recovery and new event recorded separately.
Swelling	Inflammation of a localised area, appearing as a small bump in a part of an individual's external appearance. Will disappear with the reversal of the inflammatory response and can be manipulated on an individual's exterior.
Erythema	Can appear on any part of the body The skin appears with generalised reddened skin caused by increased blood flow and vessel congestion in the skin or mucous membranes.
Haemorrhage	Can appear on any part of the body Petechiae: bleeding into the skin/tissue and gives the appearance of tiny red dots, that can be seen on their own or in clusters. Ecchymosis: Bleeding occurs as a result of blood vessels. Gives the appearance of a large bruise.
Lethargic/laboured movements	Generalised: Slowed, infrequent and/or abnormal movements and other behaviours performed abnormally, slowly and less frequently than unaffected animals. Reduced use of space, with possibly a reduction in the normal physical range of movement. Laboured hopping/jumping Laboured walking
Emaciation	When an animal loses weight (and in the absence of being weighed, when an individual shrink's in appearance with a decrease in a scored body condition but with no change in length of growth stage).
Lack of appetite	Includes the defined use of 'anorexia', which infers a physiological element Summarised, as an individual showing no attempt to seek out food when offered and/or by the weight/quantity of leftover food (those sizable to ingest).
<i>Humane end-point checks:</i>	
Apathy	General: A lack of enthusiasm or interest. Delay or loss of hop reflex Decrease in activity Loss or decrease in antipredator response Loss of aggressive behaviour A loss of a startle response Reduced responsiveness to being handled Obtunded
Poor righting reflex	When inverted: i) fails to place all four limbs back on the ground and support its own body weight; ii) laboured righting attempts, often with hind limbs extended and uncoordinated limb movements; iii) marked decrease in reaction to inversion/increase in reaction time when inverted, effects increasing with each invert. Tested 3 times.
Uncoordinated	Loss of balance and/or coordination during locomotion (walk, hop, climb) and unusual and slow eye movements, lacking in focus. Can also affect feeding behaviours, with difficulty focusing on food, may result in less successful strike for post-metamorphic or land-based amphibians. Behaviour is usually unchanged when overtly stimulated.

Table S2. Detection of RUK13 in *R. temporaria* at day 2, 4, and 6 post-exposure using quantitative PCR (qPCR) for samples obtained pre and post-euthanasia. Positive (+), negative (-), sample not done (ND).

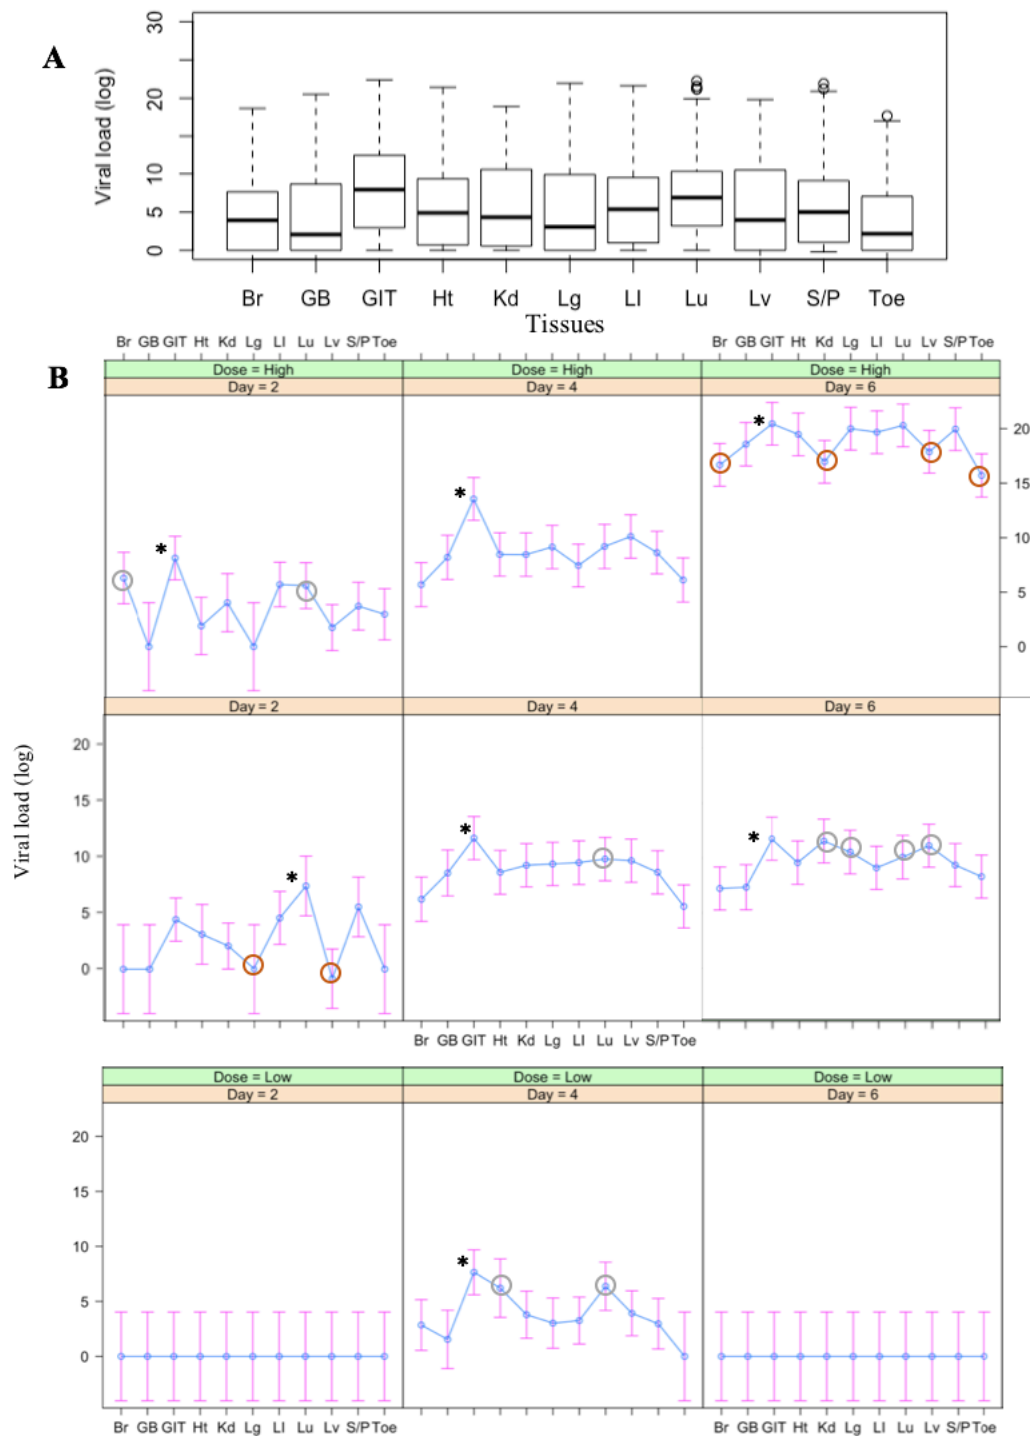

Figure S1. Predicted probabilities of viral load in *R.temporaria* generated from the zero inflated gaussian mixed model for A) tissue as a single factor and, B) tissue*day*dose as interactions. Br=brain, GB=gall bladder, GIT=gastro-intestinal tract, Ht=heart, Kd=kidney, Lg=leg muscle, LI=large intestine, Lu=lung, Lv=liver, S/P=spleen/pancreas, Toe=toe clip. * indicates a tissue with significantly higher viral loads than either tissue ringed in red, or all tissues not ringed in grey.

Figure S2. Predicted probabilities of ranavirus quantity/PCR reaction in *R. temporaria* generated from the zero inflated gaussian mixed model for sample*day*dose as interactions. BdS=body swab, BS=buccal swab, DS=digit swab, GIT=gastro-intestinal tract, Kd=kidney, Lv=liver, ST=stool, TC=toe clip, TS=tank swab. * indicates a sample with significantly higher quantities or virus than either tissue ringed in red, or all tissues not ringed in grey.

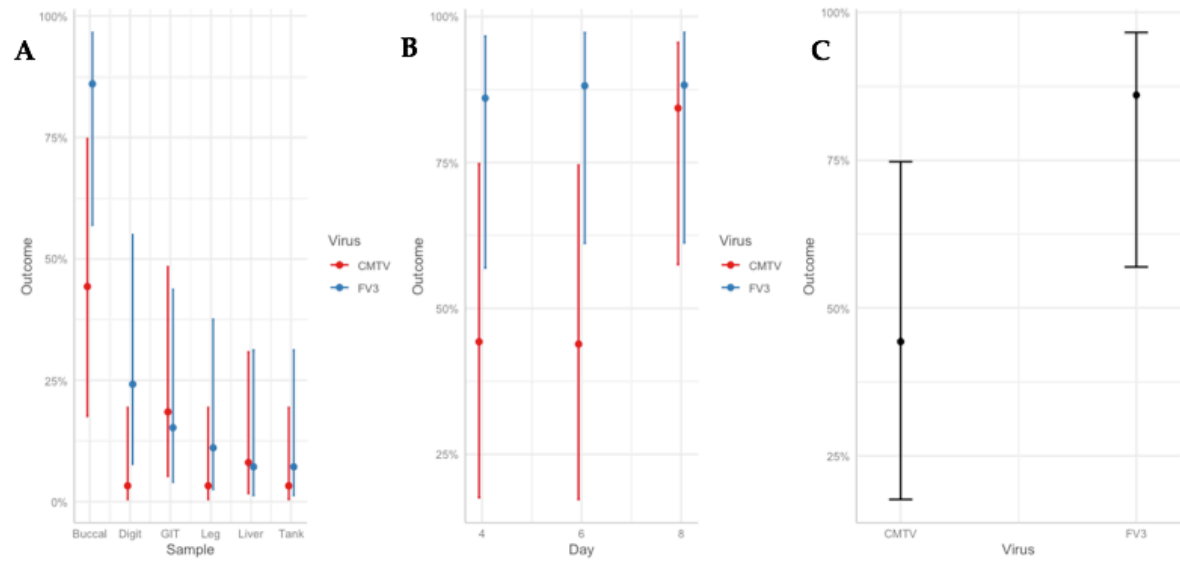

Figure S3. Predicted probabilities of outcome generated from generalised linear mixed effects model of toads for a) sample type with virus, b) virus with day and c) virus only.

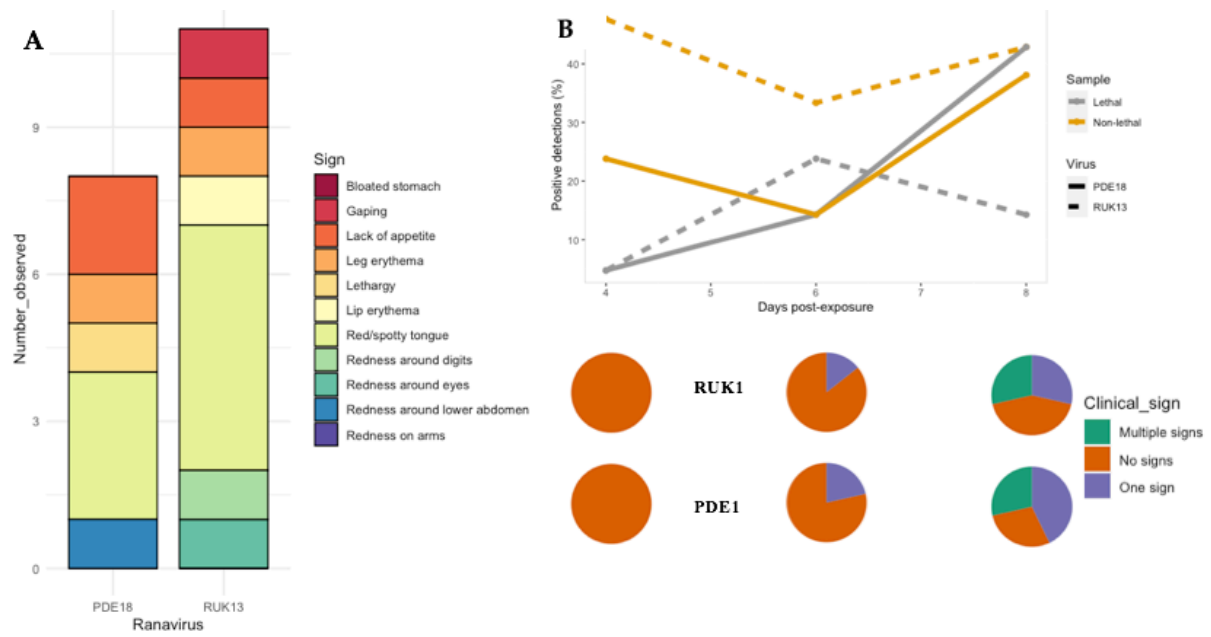

Figure S4. Clinical signs observed in *B.bufo* for both ranavirus treatment groups; a) in total, and b) by individual on sampling days compared to detectability of ranaviruses in non-lethal vs lethal samples.
