

Figure S1. Identification of HPV in the HeLa cell line by PCR. DNA from HeLa and HaCaT cell lines was isolated and amplified by PCR; amplification products were visualized on 2% agarose gels. A) Amplification of a 587 bp product of the human *Beta-actin* housekeeping gene. B) 450 bp amplicon of the L1 region of HPV with primers MY09/11. (1) Molecular weight ladder; (2) Negative control; (3) HeLa cells; (4) HaCaT cells.
