

A. RVB14

B. PV1

C. EVD70

Figure S1: CD difference spectra. For each serotype, the ZS CD spectrum was subtracted from the CD spectrum in each of the ionic environments (K, Mg & K+Mg), in order to further elucidate the change caused by cations. Serotype and ionic conditions are labeled in the Figure. See Table 1 for specific ionic conditions. RNA concentration was 0.002 mM.
