

Supplement:

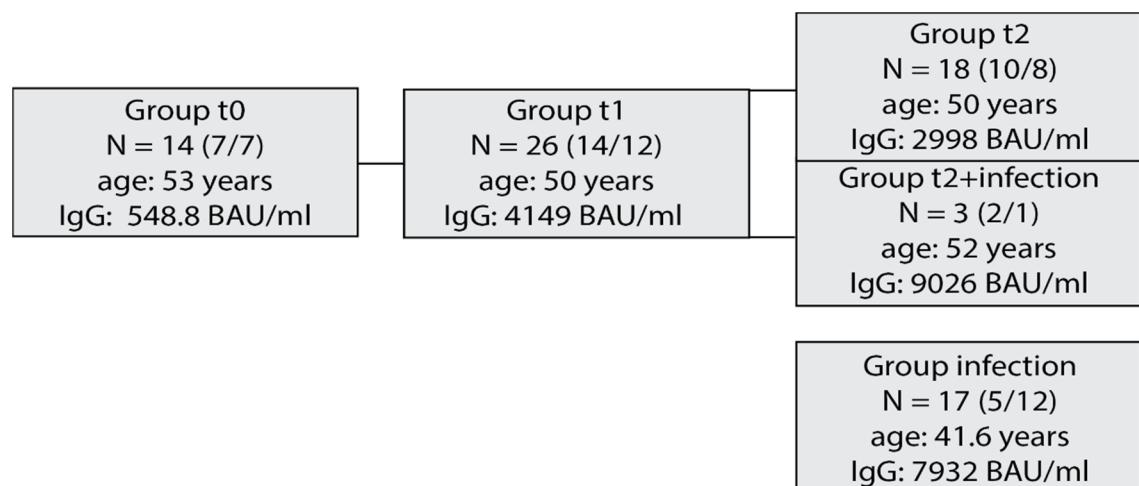

Characterization of antibody and T-cell response after second COVID-19 booster vaccination

Supplement Methods:

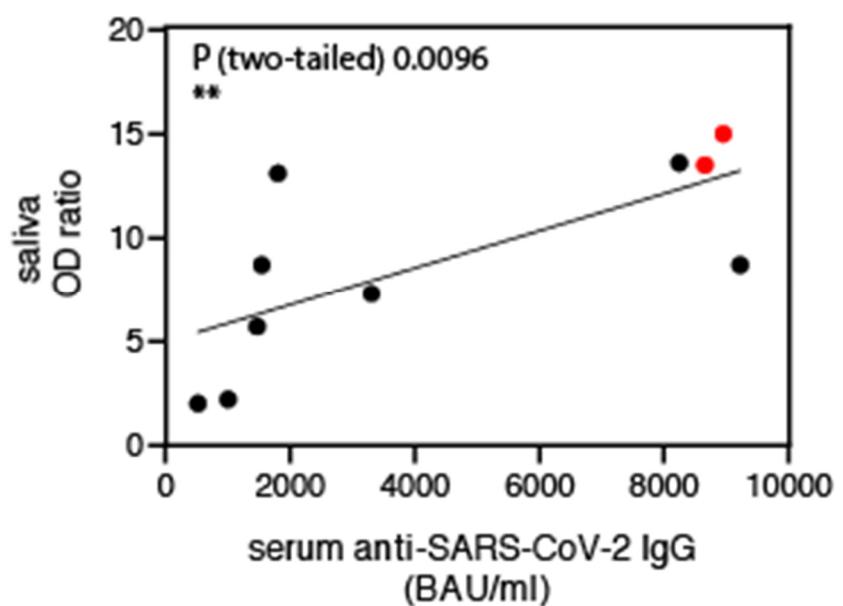

Anti-Spike-IgG assay

Serum anti-Spike receptor-binding-domain (RBD) IgG antibody concentration was determined using the SARS-CoV-2 IgG-II Quant assay and the Alinity I device (Abott Diagnostics, Germany) with an analytical measurement range from 2.98–5680 binding antibody units per mL (BAU/mL).

Supplement Figures:

Supplement Figure S1: Graphical summary of groups used in the study. N=female vs male;age and IgG = mean. For more details refer to Table S1 and S2.

Supplement Figure S2: Correlation between anti-SARS-CoV-2 Spike IgGs measured in serum using SARS-CoV-2 IgG II Quant assay (Abott) and Anti-SARS-CoV-2 ELISA in saliva (Euroimmun). N=10, red dots = infected individuals after 2nd booster vaccination (Table S1), Correlation – two-tailed, non-parametric. Asterisks (**) indicate p<0.01

Supplement Table S1: Characteristics of the study population after a second booster vaccination
