Risk of Bias

Our research question comprised 1) the overall outcome for kidney transplant recipients and 2) the comparative effectiveness of COVID-19 vaccines. We therefore used a tool which is currently in its first phase of development by members of the Cochrane Prognosis Methods Group and Cochrane Haematology, the Risk of Bias in Overall Prognosis Studies (ROB-OPS) tool for 1) and the ROBINS-I tool for non-randomized studies of interventions and the ROB-2 tool for 2).

We assessed the risk of bias by study and by outcome. Each domain received an overall rating of either low, moderate or high rating for risk of bias. Based on the domain-rating for each study and outcome, an overall rating for the outcome per study was created as follows:

- Low risk of bias: no domain rated as high or moderate risk of bias per study and outcome
- Moderate risk of bias: at least one rating as moderate risk of bias per study and outcome group.
- High risk of bias: at least one domain rated as high risk of bias per study and outcome.

Details on the RoB-OPS-tool are to be found at: <https://osf.io/dfk2r>. In Supplemental Table1, the signaling questions and domains can be found

Each domain contains one or more signalling questions and rating options to guide to either “yes”, “probably yes”, “probably no”, “no” or “not sufficient information”.

Supplemental Table S1: Risk of Bias in Overall Prognosis Studies (ROB-OPS) tool, Version 0.1

Domain	Signalling question
1. Participants	1.1 Was the method of participant recruitment appropriate?
	1.2 Were all inclusions and exclusions appropriate?
2. Outcome	2.1 Was the outcome of interest defined appropriately?

	2.2 Was the used outcome measure appropriate?
	2.3 Was the duration of follow-up appropriate?
	2.4 Was the outcome determined without knowledge of relevant baseline characteristics?
3. Analysis	3.1 Were outcome data available for all included participants or likely to be unrelated to the outcome value?
	3.2 Were missing outcome data handled appropriately?
	3.3 Was the statistical method for estimating the overall prognosis appropriate?
	3.4 Were complexities in the analysed data handled appropriately?
4. selective reporting	4.1 Is the reported outcome likely to be unselected?

Changes to the protocol

Comparisons

We aimed to compare seroconversion in patients receiving mRNA-1273 vs. BNT162b2. We found only two studies reporting on this outcome. We decided not to create descriptive summary of finding- tables due to the large number of endpoints and tables we provide in our review.

Outcome measures

Due to the very low number of studies reporting on time to infection, we decided that evidence could not reasonably be gathered from the actual information and do not report it in the review. The same applies to the composite endpoint admission to hospital or death and the endpoint death. we decided not to report mild side effects of vaccination as this has already been published several times and we did not see any additional benefit of this endpoint.

We did not predefine our reporting on correlates of protection. We assumed that several studies would report neutralization specific antibodies, but this was not the case. But we did find that studies reported on certain antibody levels associated with protection against infection. This information was extracted for all studies included in our review.

* usually reported as mean±SD or median (Q1-Q3). If reported as median (range), this was specified.

Supplemental Table S7: Co-interventions

Study	Study design	Information on Vaccination							Population Characteristics					Serologic Assessment					
		Primary vaccination series	Third dose	Fourth dose	Total vaccine doses	Intervention	Comparator	Last vaccination interval (days)*	Study population	Age	N female	Transplant vintage (months)*	Patients with additional dose N	Follow-up	De-novo response after additional dose?	Definition of serologic response	Assay	Response Intervention %	Response Comparator %
de Boer 2022	RCT	mRNA	mRNA	none	3	mRNA vaccine + Reduction of MPA dose	mRNA vaccine + MPA- free triple regime	202 (184-215)	including seropositive patients	72(4)	12 (38)	7 (5-11.24) or 8.5 (4.5-10.5)	22	2 months	de-novo response	Anti-RBD-IgG	SARS-CoV-2 IgG II Quant (Abbott©)	33.3	100.0
Kantauskaite 2022	observational	mRNA	Ad26.COv2.S or ChadOx1 or BNT162b2 Not reported separately	none	3	BNT162b2 ChadOx1, Ad26.COv2.S + Reduction of MPA dose	BNT162b2 ChadOx1, Ad26.COv2.S + MPA full dose	76 ±25	including only patients without seroconversion after primary series	63 (10)	7 (29)	30 (21–68) vs. 29 (15-45)	29	3 weeks	de-novo response	Anti-S1-IgG	Anti- spike-S1-IgG Anti-SARS-CoV-2- QuantiVac-ELISA (EUROIMMUN)	29.2	4.2
Regele 2022	NRCT	mRNA or viral vector Not reported separately	mRNA or viral vector Not reported separately	BNT162b2	4	BNT162b2+ MPA hold	BNT162b2 + MPA full dose	136 (127-141)	including only patients without seroconversion after primary series	63.97 (9.16)	15 (38)	47 (32.5-90.5)	39	1 month	de-novo response	Anti-RBD-IgG	Elecsys Anti-SARS-CoV-2 enzyme immunoassay (Roche Diagnostics)	33.3	31.8
Schrezenmeier 2022	observational	mRNA	mRNA	BNT162b2	4	BNT162b2+ MPA hold	BNT162b2 after heterologous (viral vector or mRNA) vaccination + MPA hold	59.1±12.6	including only patients without seroconversion after primary series	59.8 (14.8)	12 (41.4)	118.8 (70.8)	29	1 month	de-novo response	Anti-S-IgG	anti S- IgG (EUROIMMUN)	71.4	80.0
Yahav 2022	observational	BNT162b2	BNT162b2	none	3	BNT162b2+ Reduction or hold of MPA dose	BNT162b2+ MPA full dose	NR	including seropositive patients	NR	NR	NR	19	1 month	de-novo response	Anti-S-IgG	SARS-CoV-2 IgG II Quant (Abbott©)	53	53

* usually reported as mean±SD or median (Q1-Q3). If reported as median (range), this was specified.

Supplemental Table S8: Transplant vintage of patients with and without seroconversion

Study	Total vaccine doses	Seropositive KTRS			Seronegative KTRS		
		Seropositive KTR	TX Vintage (median)	Transplant vintage (IQR)	Seronegative KTR	Transplant vintage (median)	Transplant vintage (IQR)
Abedon 2022	3	20	6.45	3.275 - 10.275	3	4.61	1.5 - 5.55
Kantauskaite 2022	3	56	7.67	4.67 - 12.67	118	3.83	1.83 - 9.25
Seija 2022	4	15	5.67	2.83 - 12.91	26	4.10	2.83 - 10.33
Werbel 2021	3	6	9.50	4.4 - 12.4	14	4.00	2.25 - 6.75

Checklist of items to include when reporting a systematic review or meta-analysis (PRISMA)

Section/topic	#	Checklist item	Reported on page #
TITLE			
Title	1	Identify the report as a systematic review, meta-analysis, or both.	Title page
ABSTRACT			
Structured summary	2	Provide a structured summary including, as applicable: background; objectives; data sources; study eligibility criteria, participants, and interventions; study appraisal and synthesis methods; results; limitations; conclusions and implications of key findings; systematic review registration number.	First page
INTRODUCTION			
Rationale	3	Describe the rationale for the review in the context of what is already known.	Page 4
Objectives	4	Provide an explicit statement of questions being addressed with reference to participants, interventions, comparisons, outcomes, and study design (PICOS).	Page 4
METHODS			
Protocol and registration	5	Indicate if a review protocol exists, if and where it can be accessed (e.g., Web address), and, if available, provide registration information including registration number.	Page 4
Eligibility criteria	6	Specify study characteristics (e.g., PICOS, length of follow-up) and report characteristics (e.g., years considered, language, publication status) used as criteria for eligibility, giving rationale.	Pages 4 to 5
Information sources	7	Describe all information sources (e.g., databases with dates of coverage, contact with study authors to identify additional studies) in the search and date last searched.	Pages 4 to 5 and Appendix
Search	8	Present full electronic search strategy for at least one database, including any limits used, such that it could be repeated.	Appendix
Study selection	9	State the process for selecting studies (i.e., screening, eligibility, included in systematic review, and, if applicable, included in the meta-analysis).	Figure 1

Section/topic	#	Checklist item	Reported on page #
Data collection process	10	Describe method of data extraction from reports (e.g., piloted forms, independently, in duplicate) and any processes for obtaining and confirming data from investigators.	Pages 4 to 5
Data items	11	List and define all variables for which data were sought (e.g., PICOS, funding sources) and any assumptions and simplifications made.	Pages 4 to 5
Risk of bias in individual studies	12	Describe methods used for assessing risk of bias of individual studies (including specification of whether this was done at the study or outcome level), and how this information is to be used in any data synthesis.	Pages 4 to 5
Summary measures	13	State the principal summary measures (e.g., risk ratio, difference in means).	Pages 4 to 5
Synthesis of results	14	Describe the methods of handling data and combining results of studies, if done, including measures of consistency (e.g., I^2) for each meta-analysis.	Pages 4 to 5
Risk of bias across studies	15	Specify any assessment of risk of bias that may affect the cumulative evidence (e.g., publication bias, selective reporting within studies).	Page 9
Additional analyses	16	Describe methods of additional analyses (e.g., sensitivity or subgroup analyses, meta-regression), if done, indicating which were pre-specified.	Pages 4 to 5
RESULTS			
Study selection	17	Give numbers of studies screened, assessed for eligibility, and included in the review, with reasons for exclusions at each stage, ideally with a flow diagram.	Page 6, Fig.1
Study characteristics	18	For each study, present characteristics for which data were extracted (e.g., study size, PICOS, follow-up period) and provide the citations.	Appendix Table 2
Risk of bias within studies	19	Present data on risk of bias of each study and, if available, any outcome-level assessment (see Item 12).	Appendix Fig. 1
Results of individual studies	20	For all outcomes considered (benefits or harms), present, for each study: (a) simple summary data for each intervention group and (b) effect estimates and confidence intervals, ideally with a forest plot.	Pages 6 to 9, Figures 2 and 3

Section/topic	#	Checklist item	Reported on page #
Synthesis of results	21	Present results of each meta-analysis done, including confidence intervals and measures of consistency.	n.a.
Risk of bias across studies	22	Present results of any assessment of risk of bias across studies (see Item 15).	n.a.
Additional analysis	23	Give results of additional analyses, if done (e.g., sensitivity or subgroup analyses, meta-regression) (see Item 16).	Pages 8 to 9, Appendix tables 7, 8, Appendix figure 3
DISCUSSION			
Summary of evidence	24	Summarize the main findings including the strength of evidence for each main outcome; consider their relevance to key groups (e.g., health care providers, users, and policy makers).	Page 10
Limitations	25	Discuss limitations at study and outcome level (e.g., risk of bias), and at review level (e.g., incomplete retrieval of identified research, reporting bias).	Page 10
Conclusions	26	Provide a general interpretation of the results in the context of other evidence, and implications for future research.	Page 11
FUNDING			
Funding	27	Describe sources of funding for the systematic review and other support (e.g., supply of data); role of funders for the systematic review.	Page 6
