Message from the Guest Editor

There is a current need to improve the effect of the operation efficiency of UAVs for use in agricultural applications. This is one of the most pressing challenges for modern agricultural drones. In this view, the efficiency priority principle in UAV operations is widely recognized because it can maximize the advantage of drones. Therefore, in the current operation efficiency of UAVs it is important to learn more about how to design a UAV pattern to improve the effect of UAV operation. In the course of operation, the use of variable spray, following the arrangement of the coronal layer, suppression drift, multi-machine coordination and optimal energy consumption can guarantee the efficiency and increase the benefits of UAV operation.

The focus of this Special Issue is to develop and evaluate methods to improve the effectiveness of UAV operations. The research will cover UAVs for different crops, including vegetable crops, ornamental crops and large fields, and crops from other management ecosystems. Welcome various types of articles, such as original research papers and comments.

an Open Access Journal by MDPI

Message from the Editor-in-Chief

Agriculture (ISSN 2077-0472) is an international, crossdisciplinary and scholarly open access journal on the science and technology of crop and animal production, and management of the natural resource base for agricultural production. *Agriculture* is published in an open access format – research articles, reviews and other contents are released on the internet immediately after acceptance. The scientific community and the public have unlimited and free access to the content as soon as it is published.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), PubAg, AGRIS, RePEc, and other databases.

Journal Rank: JCR - Q1 (Agronomy) / CiteScore - Q1 (Plant Science)
