Special Issue

Integrated Pest Management Strategies for Food Processing and Storage Facilities

Message from the Guest Editor

Insects pose a significant threat to stored products. Currently, insect control at the post-harvest stages of agricultural products is primarily based on the use of contact insecticides and fumigants, such as phosphine, which are directly applied either to the product or to the storage and processing facility. However, the continuous use of these insecticides has led to the development of resistance by several major insect species, often rendering chemical control ineffective. Furthermore, many traditional substances are no longer in use due to their high toxicity to mammals and extreme threat to the environment. This Special Issue aims to highlight the development, application, and evaluation of integrated pest management (IPM) strategies in food processing and storage facilities. It will focus on innovative approaches and technologies that offer sustainable and effective solutions for managing stored-product pests. For this Special Issue, we welcome all types of articles. We encourage studies that offer practical, high-precision, and innovative solutions with promising applications in the field of pest management.

About the Journal

Message from the Editor-in-Chief

Agriculture (ISSN 2077-0472) is an international, scholarly and scientific open access journal publishing peer-reviewed research papers, review articles, communications and short notes that reflect the breadth and interdisciplinarity of agriculture.

Editor-in-Chief

Prof. Dr. Les Copeland

Sydney Institute of Agriculture, School of Life and Environmental Sciences, The University of Sydney, Sydney, NSW 2006, Australia

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubAg, AGRIS, RePEc, and other databases.

Journal Rank:

JCR - Q1 (Agronomy) / CiteScore - Q1 (Plant Science)
