Advances in Biological Pest Control in Agroecosystems

Message from the Guest Editors

Biological pest control (the introduction and conservation of natural enemies) has proven to be an effective and economically viable control method and is the basis of integrated pest management (IPM) in combination with other control methods. Biological pest control has now been implemented in numerous crops and has become established in large production areas. There is a need to ascertain the efficacy and compatibility of other control methods (e.g., pesticide treatments or cultural practices) with biocontrol agents. One of the most significant challenges in the field of biological pest control is to comprehend the impact of the introduction or conservation of these biocontrol agents on the biodiversity of the crop, as well as that of the environment in which these agroecosystems are situated. These concerns will be addressed in a Special Issue of *Agriculture*, which will focus on the latest developments in biological pest control and their potential future applications in agroecosystems.

About the Journal

Message from the Editor-in-Chief

Agriculture (ISSN 2077-0472) is an international, scholarly and scientific open access journal publishing peer-reviewed research papers, review articles, communications and short notes that reflect the breadth and interdisciplinarity of agriculture.

Editor-in-Chief

Prof. Dr. Les Copeland
Sydney Institute of Agriculture, School of Life and Environmental
Sciences, The University of Sydney, Sydney, NSW 2006, Australia

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus, SCIE (Web of Science), GEOBASE, PubAg, AGRIS, RePEc, and other databases.

Journal Rank:

JCR - Q1 (Agronomy) / CiteScore - Q1 (Plant Science)
