Effects of Agricultural Management Practices on Soil Fertility and Microbiome Structure

Message from the Guest Editors

Dear colleagues, Soil is of fundamental importance for food production since it provides resources enabling crop cultivation. Soil is a non-renewable resource, since the process of soil formation is extremely slow. The formation of soil, the mineralization of nutrients, and the turnover of soil organic matter are all closely regulated by soil microbes. Intense agrochemical use, short crop rotations, and ploughing led to a deep intensification of agricultural practises that result in erosion, loss of soil fertility, and a build-up of soil-borne plant diseases. Crop production and health are closely related to soil microbial communities, which are important participants in ecosystem processes. The impact of farming practises, including tillage methods and fertiliser intensities, on soil microbiomes is currently poorly understood. For agricultural farming practises to be more effective and for planned sustainability to be achieved, a deeper comprehension of these interrelationships is required.

About the Journal

Message from the Editor-in-Chief

Agriculture (ISSN 2077-0472) is an international, scholarly and scientific open access journal publishing peer-reviewed research papers, review articles, communications and short notes that reflect the breadth and interdisciplinarity of agriculture.

Editor-in-Chief

Prof. Dr. Les Copeland
Sydney Institute of Agriculture, School of Life and Environmental
Sciences, The University of Sydney, Sydney, NSW 2006, Australia

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus, SCIE (Web of Science), GEOBASE, PubAg, AGRIS, RePEc, and other databases.

Journal Rank:

JCR - Q1 (Agronomy) / CiteScore - Q1 (Plant Science)
