Feeding Strategies and Nutritional Quality of Animal Products—Volume II

Message from the Guest Editors

Feeding strategies play a pivotal role in determining the nutritional composition of animal products. The unique digestive systems of ruminants can efficiently convert fibrous plant material into high-quality protein sources. Monogastric animals necessitate diets that are precisely formulated to meet their nutrient needs. This influences the growth rate, feed efficiency, and nutrient content of their final products. This Special Issue aims to bring together research studies that investigate different feeding strategies, offering insights into optimizing animal diets to improve animal health and production, while enhancing the nutritional value and quality characteristics of animal-derived products. This Special Issue is dedicated to being a platform for interdisciplinary studies on animal nutrition, physiology, chemistry, raising technologies, feeding strategies, and product quality. The articles will cover a wide range of topics related to feed quality, and the feed's effect on production, animals' health, and product quality.

About the Journal

Message from the Editor-in-Chief

Agriculture (ISSN 2077-0472) is an international, scholarly and scientific open access journal publishing peer-reviewed research papers, review articles, communications and short notes that reflect the breadth and interdisciplinarity of agriculture.

Editor-in-Chief

Prof. Dr. Les Copeland
Sydney Institute of Agriculture, School of Life and Environmental
Sciences, The University of Sydney, Sydney, NSW 2006, Australia

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubAg, AGRIS, RePEc, and other databases.

Journal Rank:

JCR - Q1 (Agronomy) / CiteScore - Q1 (Plant Science)
