

Special Issue

Soil Fertility

Message from the Guest Editor

Soil fertility is the capacity to support plant growth. It is the component of overall soil productivity that deals with its available nutrient status, and its ability to provide nutrients out of its own reserves and through external applications for crop production. There are three main components of soil fertility: Physical, chemical and biological. The level of soil fertility results from the inherent characteristics of the soil and the interactions that occur between these three components during crop management. This Special Issue on “Soil Fertility” will welcome contributions (original research and reviews) addressing the best options to improve crop and soil management while limiting the environmental problems caused by agricultural activity and maintaining ecosystem services. Articles may include, but are not limited to, the following topics:

- Conservation tillage
- Crop rotation and use of legumes
- Soil cover (cover crops, mulch)
- Crop residues
- Organic fertilizers (including manure and compost)
- Fertilizer application

About the Journal

Message from the Editor-in-Chief

Agriculture (ISSN 2077-0472) is an international, scholarly and scientific open access journal publishing peer-reviewed research papers, review articles, communications and short notes that reflect the breadth and interdisciplinarity of agriculture.

Editor-in-Chief

Prof. Dr. Les Copeland
Sydney Institute of Agriculture, School of Life and Environmental
Sciences, The University of Sydney, Sydney, NSW 2006, Australia

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus, SCIE (Web of Science), GEOBASE, PubAg, AGRIS, RePEc, and other databases.

Journal Rank:

JCR - Q1 (Agronomy) / CiteScore - Q1 (Plant Science)
