Plant Anthracnose: Etiology and Current Management Options

Message from the Guest Editor

Plant anthracnose caused by *Colletotrichum* spp. is a fungal disease devastating farmers and causing huge economic losses around the world. The occurrence and effects of anthracnose disease are very common in tropical and subtropical areas where the climatic conditions are warm and humid, but recent research has shown some high-profile species of *Colletotrichum* surviving in the temperate regions, and thus, affecting the temperate crops. The increasing studies of occurrence, pathogenesis, and control technologies of plant anthracnose and ethnographic data can provide crucial information on this issue and enhance our understanding of the etiology, diversity and management of plant anthracnose on a global scale. Recently, the mechanisms of interactions in plant anthracnose and applying genetic engineering strategies for the control of anthracnose are the hot and cutting-edge research topics. For this Special Issue of *Agronomy*, we seek integrative studies focusing on the etiology and control strategies of plant anthracnose, as well as reviews that offer original perspectives on pathogenic mechanisms and the control of anthracnose in major crops.

About the Journal

Message from the Editor-in-Chief

Agronomy draws together researchers from diverse areas of agricultural research with a common aim of enhancing agricultural productivity globally. The journal provides unlimited free access to all those interested in advancing agricultural science from both the research and general community. Papers are released immediately after acceptance through the internet.

Agronomy is supported by our authors and their institutes through low article processing charges (APC) for accepted papers. We hope you will support the journal by becoming one of our authors.

Editor-in-Chief

Prof. Dr. Leslie A. Weston
