

Special Issue

Soil Degradation Prevention and Restoration at Farm and Field Scale

Message from the Guest Editors

Dear colleagues, Preventing and restoring degraded soils is often difficult. Soils vary so much between regions, farms, and even individual fields that no single solution fits all cases, and therefore, solutions need to be tailored to each local condition. Moreover, the multiplicity and dynamicity of drivers and technologies calls for a continuous development of research studies. This Special issue will focus on soil management solutions at the farm and field scale based on the understanding of degradation processes for different pedoclimatic conditions, land uses, and management systems. Experiences on the timing, effectiveness, and side-effects of the measures taken to contrast one or more processes will be an essential part. Evidence on win-win strategies to balance different and competing soil services, as well as socioeconomic, political, and cultural factors are welcome. Methodological approaches and tools applied in case studies are also welcome. Dr. E. A. C. Costantini

About the Journal

Message from the Editor-in-Chief

Agronomy draws together researchers from diverse areas of agricultural research with a common aim of enhancing agricultural productivity globally. The journal provides unlimited free access to all those interested in advancing agricultural science from both the research and general community. Papers are released immediately after acceptance through the internet.

Agronomy is supported by our authors and their institutes through low article processing charges (APC) for accepted papers. We hope you will support the journal by becoming one of our authors.

Editor-in-Chief
