

Special Issue

Impact of Biochar and Compost on Soil Quality and Crop Yield

Message from the Guest Editor

It is widely recognized that composting and pyrolysis are two processes for reducing organic waste storages, with products used as soil amendments. Compost and biochar application has a beneficial impact on the physical, chemical and biological properties of soils what reflects in crop yields. However, these soil amendments creates also some risk, e.g. water repellency, nutrient deficiency, heavy metal contamination, especially when municipal wastes or sewage sludge are used as feedstock. Still little information is available concerning the long-term effect of compost and biochar application, effect of their combined usage (including co-composting) and the interactions between feedstocks, soil characteristics and crop species. This Special Issue will focus on the "Impact of Biochar and Compost on Soil Quality and Crop Yield". Long term experiments, field trials with different soils or crops are exceptionally valuable.

About the Journal

Message from the Editor-in-Chief

Agronomy draws together researchers from diverse areas of agricultural research with a common aim of enhancing agricultural productivity globally. The journal provides unlimited free access to all those interested in advancing agricultural science from both the research and general community. Papers are released immediately after acceptance through the internet.

Agronomy is supported by our authors and their institutes through low article processing charges (APC) for accepted papers. We hope you will support the journal by becoming one of our authors.

Editor-in-Chief

Prof. Dr. Leslie A. Weston
