

Special Issue

Effects of Agricultural Management on Soil Properties and Health

Message from the Guest Editor

The International Year of Plant Health is 2020, and this special issue is taking a broad focus on the effects of agricultural management on soil properties and health for a sustainable and productive agricultural landscape. This special issue contributes to the wider agenda of SDGs. Increasingly sustainable soil management, and along with it plant health, is being threatened by a continued decline in the amount of arable land through deteriorating soil condition or land-use change. Farmers and land managers, around the world, need practical and adoptable measures to improve this situation and in areas where they can largely control such as good agricultural practices, monitoring of soil properties and health, and system transformation. This special issue would welcome researchers from a wide disciplinary background to share their research into the effects of agricultural management on soil properties and health and the wider ramifications for a productive and sustainable agricultural landscape in an increasingly changing and disrupted world.

About the Journal

Message from the Editor-in-Chief

Agronomy draws together researchers from diverse areas of agricultural research with a common aim of enhancing agricultural productivity globally. The journal provides unlimited free access to all those interested in advancing agricultural science from both the research and general community. Papers are released immediately after acceptance through the internet.

Agronomy is supported by our authors and their institutes through low article processing charges (APC) for accepted papers. We hope you will support the journal by becoming one of our authors.

Editor-in-Chief

Prof. Dr. Leslie A. Weston
