New Insights in Veterinary Endoscopy: From Diagnosis to Therapy

Message from the Guest Editors

Endoscopy is a useful diagnostic technique for the detection of benign or malignant lesions in veterinary medicine. Examinations of upper and lower airways, upper and lower gastrointestinal tract, and urogenital tract are commonly performed in small and large animals. The technological developments achieved in recent years have enabled endoscopy to take on a therapeutic role in the management of respiratory, digestive, and urogenital diseases. Moreover, artificial intelligence-based applications could improve the diagnosis and treatment of specific conditions, and follow-up procedures in veterinary endoscopy, as recently reported in human medicine. This Special Issue of *Animals* aims to collect the most significant and recent research regarding recent advancements in veterinary endoscopic imaging and therapy. Therefore, original research studies as well as review articles with a focus on the most recent insights regarding diagnostic and therapeutic veterinary endoscopy are welcome.

2. Curtin University Sustainability Policy (CUSP) Institute, Kent St., Bentley 6102, Australia

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, PMC, Embase, PubAg, AGRIS, Animal Science Database, CAB Abstracts, and other databases.

Journal Rank:

JCR - Q1 (Veterinary Sciences) / CiteScore - Q1 (General Veterinary)
