

## Special Issue

# Advances on Canine and Feline Mammary Tumours

### Message from the Guest Editors

Spontaneous mammary gland tumors represent the most commonly diagnosed neoplasms in female dogs and constitute the third most frequent neoplasm in female cats. These naturally occurring tumors have been suggested as animal models for human breast cancer, due to similarities with their human counterpart in terms of etiopathogenesis, clinicopathological characteristics and biological behavior. Although canine and feline mammary tumors have attracted considerable attention over the years, which is reflected on the escalating number of publications, further studies are warranted. In this Special Issue of *Animals*, we invite you to submit high-quality original research, reviews or reports focusing on canine and feline mammary tumors, including basic research, preclinical and clinical investigations. We anticipate that this Special Issue will expand our current knowledge on canine and feline mammary tumors, advancing new information on several aspects in a joint effort of veterinary pathologists, oncologists and other researchers.

### Author Benefits

#### Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

#### High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, PMC, Embase, PubAg, AGRIS, Animal Science Database, CAB Abstracts, and other databases.

#### Journal Rank:

JCR - Q1 (Veterinary Sciences) / CiteScore - Q1 (General Veterinary)
