Oxidative Stress Induced by High Salt Diet

Message from the Guest Editors

It is well documented that high dietary kitchen salt (NaCl) intake is a major risk factor in the development of hypertension and, consequently, multiorgan damage. Importantly, a high salt diet impairs endothelial function, even without changes in blood pressure, leading to impaired endothelium-dependent responses to various stimuli, and thus contributing to cardiovascular morbidity and mortality. We invite you to submit your latest research findings or review articles to this Special Issue, which will bring together current research concerning high salt diets and oxidative stress in both normal processes and diseased states.

About the Journal

Message from the Editor-in-Chief

It has been recognized in medical sciences that in order to prevent adverse effects of “oxidative stress” a balance exists between prooxidants and antioxidants in living systems. Imbalances are found in a variety of diseases and chronic health situations. Our journal *Antioxidants* serves as an authoritative source of information on current topics of research in the area of oxidative stress and antioxidant defense systems. The future is bright for antioxidant research and since 2012, *Antioxidants* has become a key forum for researchers to bring their findings to the forefront.

Editor-in-Chief

Prof. Dr. Alessandra Napolitano

Department of Chemical Sciences, University of Naples “Federico II”,
Via Cintia 4, I-80126 Naples, Italy

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, PMC, FSTA, PubAg, CAPlus / SciFinder, and other databases.

Journal Rank:

JCR - Q1 (Chemistry, Medicinal) / CiteScore - Q1 (Food Science)
