Message from the Guest Editor

Dear Colleagues,

Recently, an especially popular field of deep learning applications has been that of computer vision and pattern recognition. Typical examples of areas where deep networks have been used are object detection, face detection and recognition, optical character recognition, and image classification. In this Special Issue, we welcome contributions from scholars in all related subjects, presenting either a deep learning solution to a novel application, or a deep learning enhancement to a preexisting application.

Prof. Athanasios Nikolaidis
