Message from the Guest Editor

A healthy diet is one of the basic conditions for a healthy lifestyle. However, to implement a healthy diet, it is necessary to have access to food with high nutritional value, containing significant amounts of health-promoting ingredients with a preventive effect against the rapidly spreading so-called life-style diseases.

Science and technology go hand in hand in food enhancement, in terms of preserving and enhancing nutritional value and desirable health influence. The most urgent goal seems to be to work on confirming the effect of bioactive substances, which are or can become food ingredients, and which alone or in synergy with the entire matrix, will be able to strengthen the human immune system in fighting diseases and have a positive effect on metabolism. It requires a lot of work and provides an opportunity for interesting and necessary research for scientists in the fields of biology, food technology, medicine and dietetics. We expect that many interesting papers will be created in this area, the results of which will be disseminated and published in this Special Issue.

- Health-promoting ingredients
- Bioactive substances
- Disease prevention
- Functional food.
