## Current Applications of Microfluidics for Biosensing and Diagnostics

## Message from the Guest Editors

Microfluidics is rapidly emerging as a powerful tool in biosensing and diagnostics due to its ability to manipulate small volumes of fluids with high precision. Microfluidic devices equipped with sensors provide a platform to track physiological signals such as heart rate, blood glucose levels, temperature, oxygen saturation, and so on. In particular, biosensors incorporated into in vivo models can be used for the accurate and reliable predictions of biological responses to various stimuli, including drugs and toxins. Moreover, advanced data analysis techniques and Albased decision-making algorithms play an essential role in interpreting biosensor data. By leveraging machine learning and artificial intelligence, these technologies can analyze vast amounts of data, recognize patterns, and make predictive recommendations. This improves the efficiency and reliability of diagnostics, allowing for earlier detection and more effective treatments.

## **About the Journal**

## Message from the Editor-in-Chief

As the world of science becomes ever more specialized, researchers may lose themselves in the deep forest of the ever increasing number of subfields being created. This open access journal *Applied Sciences* has been started to link these subfields, so researchers can cut through the forest and see the surrounding, or quite distant fields and subfields to help develop his/her own research even further with the aid of this multi-dimensional network.

## **Editor-in-Chief**

Prof. Dr. Giulio Nicola Cerullo

Dipartimento di Fisica, Politecnico di Milano, Piazza L. da Vinci 32, 20133 Milano, Italy

## **Author Benefits**

## **Open Access:**

free for readers, with article processing charges (APC) paid by authors or their institutions.

## **High Visibility:**

indexed within Scopus, SCIE (Web of Science), Ei Compendex, Inspec, CAPlus / SciFinder, and other databases.
