Special Metrics

Message from the Guest Editor

Special metrics arise naturally in Differential Geometry and Theoretical Physics. They are usually characterized by conditions on the curvature. The most important class of such metrics is the one of constant Ricci-curvature, or Einstein metrics. Such metrics are often the best candidates for the role of canonical metrics on manifolds and thus have a very important role in Topology. They have been also studied in theoretical physics, initially in General Relativity but more recently also in Superstring Theories. One of the important objects associated with a metric is the holonomy group. The study of compact manifolds with special holonomy is relevant not only in Differential Geometry and Theoretical Physics, but also in relation with Algebraic Geometry. The goal of this Special Issue is to provide a collection of research and survey papers that reflect the research on special (pseudo-)Riemannian metrics in Differential Geometry, in relation with Topology, Algebraic Geometry, and Superstring Theories.

About the Journal

Message from the Editor-in-Chief

Axioms is dedicated to the foundations (structure and axiomatic basis, in particular) of mathematical theories, not only from a crisp or strictly classical sense, but also from a fuzzy and generalized sense. This includes the more innovative current scientific trends, devoted to discover and solve new challenging problems. The prime goal of *Axioms* is to publish first-class, original research articles under an open access policy with minimal fees for the authors. We would be pleased to welcome you as one of our authors.

Editor-in-Chief

Prof. Dr. Humberto Bustince

Department of Statistics, Computer Science and Mathematics, Public
University of Navarra, 31006 Pamplona, Spain
